

## Problem #86

*Originator: Hans Zantema*

*Date: April 1995*

*Summary: Is the union of two totally terminating rewrite systems, which do not share any symbols, totally terminating?*

When there exists a monotonic well-ordering (*monotonic* means that replacing a subterm with a smaller one decreases the whole term) of ground terms that shows termination of a rewrite system, the system is called *totally terminating*. The union of two totally terminating rewrite systems which do not share any symbols is totally terminating if at least one of them does not contain a rule that has more occurrences of some variable on the right than on the left [FZ93, FZ96]. What if variables are duplicated?
