Advanced topics in data structures:

bibliography list

The range product problem in arbitrary semigroups appears in [18, 5, 1]. The material on weak epsilon nets in convex sets is from [2]. Lowest common ancestor algorithms are in [9, 15, 4]. Algorithms to construct suffix trees in linear time are in [17, 14, 16, 6]. Suffix arrays were introduced in [13]. The linear time construction algorithm for suffix arrays is from [10]. The simple construction of the LCP array from the suffix array is from [11]. The k-mismatch problem is discussed in [7, 12, 3]. Some of the stuff appears in the book by Gusfield [8].
