

# Abstract Interpretation

## Part I

Mooly Sagiv

Textbook: Chapter 4

# The Abstract Interpretation Technique (Cousot & Cousot)

- ◆ The foundation of program analysis
- ◆ Defines the meaning of the information computed by static tools
- ◆ A mathematical framework
- ◆ Allows proving that an analysis is sound in a local way
- ◆ Identify design bugs
- ◆ Understand where precision is lost
- ◆ New analysis from old
- ◆ Not limited to certain programming style

# Outline

- ◆ Monotone Frameworks with Widening
- ◆ Galois Connections (Insertions)
- ◆ Collecting semantics
- ◆ **The Soundness Theorem**

# Specialized Chaotic Iterations

Chaotic( $G(V, E)$ : Graph,  $s$ : Node,  $L$ : lattice,  $\perp$ :  $L$ ,  $f$ :  $E \rightarrow (L \rightarrow L)$  ) {

  for each  $v$  in  $V$  to  $n$  do  $df_{\text{entry}}[v] := \perp$

$In[v] = \perp$

$WL = \{s\}$

  while ( $WL \neq \emptyset$ ) do

    select and remove an element  $u \in WL$

    for each  $v$ , such that.  $(u, v) \in E$  do

$temp = f(e)(df_{\text{entry}}[u])$

$new := df_{\text{entry}}(v) \sqcup temp$

      if ( $new \neq df_{\text{entry}}[v]$ ) then

$df_{\text{entry}}[v] := new;$

$WL := WL \cup \{v\}$

# Widening

- ◆ Accelerate the termination of Chaotic iterations by computing a more conservative solution
- ◆ Can handle lattices of infinite heights

# Specialized Chaotic Iterations+ $\nabla$

Chaotic( $G(V, E)$ : Graph,  $s$ : Node,  $L$ : lattice,  $\iota$ :  $L$ ,  $f$ :  $E \rightarrow (L \rightarrow L)$  ) {

  for each  $v$  in  $V$  to  $n$  do  $df_{\text{entry}}[v] := \perp$

$In[v] = \iota$

$WL = \{s\}$

  while ( $WL \neq \emptyset$ ) do

    select and remove an element  $u \in WL$

    for each  $v$ , such that.  $(u, v) \in E$  do

$temp = f(e)(df_{\text{entry}}[u])$

$new := df_{\text{entry}}(v) \nabla temp$

      if ( $new \neq df_{\text{entry}}[v]$ ) then

$df_{\text{entry}}[v] := new;$

$WL := WL \cup \{v\}$

# Example Interval Analysis

- ◆ Find a lower and an upper bound of the value of a variable
- ◆ Usages?
- ◆ Lattice

$$L = (\mathbb{Z} \cup \{-\infty, \infty\} \times \mathbb{Z} \cup \{-\infty, \infty\}, \sqsubseteq, \sqcup, \sqcap, \perp, \top)$$

- $[a, b] \sqsubseteq [c, d]$  if  $c \leq a$  and  $d \geq b$
- $[a, b] \sqcup [c, d] = [\min(a, c), \max(b, d)]$
- $[a, b] \sqcap [c, d] = [\max(a, c), \min(b, d)]$
- $\top =$
- $\perp =$

# Example Program

## Interval Analysis

```
[x := 1]1 ;  
while [x ≤ 1000]2 do  
  [x := x + 1;]3
```

$\text{IntEntry}(1) = [\text{minint}, \text{maxint}]$

$\text{IntExit}(1) = [1, 1]$

$\text{IntEntry}(2) = \text{IntExit}(1) \sqcup \text{IntExit}(3)$

$\text{IntExit}(2) = \text{IntEntry}(2)$

$\text{IntEntry}(3) = \text{IntExit}(2) \sqcap [\text{minint}, 1000]$

$\text{IntExit}(3) = \text{IntEntry}(3) + [1, 1]$

$\text{IntEntry}(4) = \text{IntExit}(2) \sqcap [1001, \text{maxint}]$

$\text{IntExit}(4) = \text{IntEntry}(4)$

# Widening for Interval Analysis

- ◆  $\perp \nabla [c, d] = [c, d]$
- ◆  $[a, b] \nabla [c, d] = [$   
    if  $a \leq c$   
        then  $a$   
        else  $-\infty,$   
    if  $b \geq d$   
        then  $b$   
        else  $\infty$   
    ]

# Example Program

## Interval Analysis

```
[x := 1]1 ;  
while [x ≤ 1000]2 do  
  [x := x + 1;]3
```

$$\text{IntEntry}(1) = [-\infty, \infty]$$

$$\text{IntExit}(1) = [1, 1]$$

$$\text{IntEntry}(2) = \text{IntExit}(2) \nabla (\text{IntExit}(1) \sqcup \text{IntExit}(3))$$

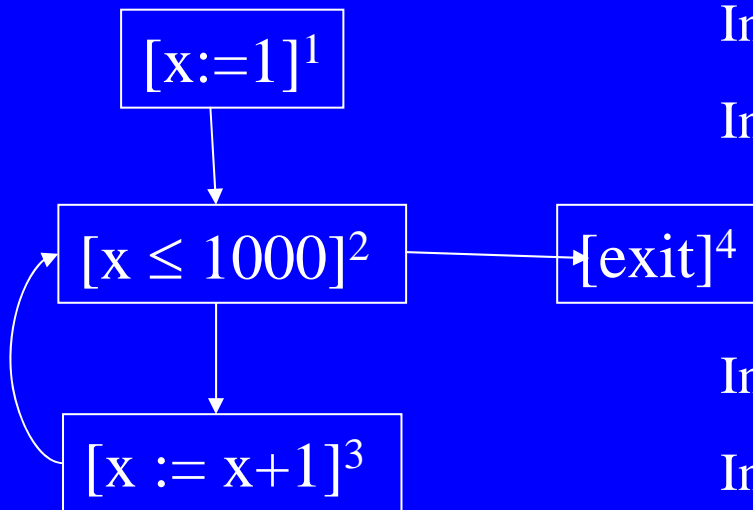

$$\text{IntExit}(2) = \text{IntEntry}(2)$$

$$\text{IntEntry}(3) = \text{IntExit}(2) \sqcap [-\infty, 1000]$$

$$\text{IntExit}(3) = \text{IntEntry}(3) + [1, 1]$$

$$\text{IntEntry}(4) = \text{IntExit}(2) \sqcap [1001, \infty]$$

$$\text{IntExit}(4) = \text{IntEntry}(4)$$

# Requirements on Widening

- ◆ For all elements  $l_1 \sqcup l_2 \sqsubseteq l_1 \nabla l_2$
- ◆ For all ascending chains  
 $l_0 \sqsubseteq l_1 \sqsubseteq l_2 \sqsubseteq \dots$   
the following sequence is finite
  - $y_0 = l_0$
  - $y_{i+1} = y_i \nabla l_{i+1}$
- ◆ For a monotonic function  
 $f: L \rightarrow L$   
define
  - $x_0 = \perp$
  - $x_{i+1} = x_i \nabla f(x_i)$
- ◆ Theorem:
  - There exists  $k$  such that  $x_{k+1} = x_k$
  - $x_k \in \text{Red}(f) = \{l: l \in L, f(l) \sqsubseteq l\}$

# Narrowing

- ◆ Improve the result of widening
- ◆  $y \sqsubseteq x \Rightarrow y \sqsubseteq (x \Delta y) \sqsubseteq x$
- ◆ For all decreasing chains  $x_0 \supseteq x_1 \supseteq \dots$   
the following sequence is finite
  - $y_0 = x_0$
  - $y_{i+1} = y_i \Delta x_{i+1}$
- ◆ For a monotonic function  $f: L \rightarrow L$  and  $x \in \text{Red}(f) = \{l: l \in L, f(l) \sqsubseteq l\}$   
define
  - $y_0 = x$
  - $y_{i+1} = y_i \Delta f(y_i)$
- ◆ Theorem:
  - There exists  $k$  such that  $y_{k+1} = y_k$
  - $y_k \in \text{Red}(f) = \{l: l \in L, f(l) \sqsubseteq l\}$

# Narrowing for Interval Analysis

◆  $[a, b] \triangle \perp = [a, b]$

◆  $[a, b] \triangle [c, d] = [$   
    if  $a = -\infty$   
        then  $c$   
        else  $a,$   
if  $b = \infty$   
    then  $d$   
    else  $b$   
    ]

# Example Program

## Interval Analysis

```
[x := 1]1 ;  
while [x ≤ 1000]2 do  
  [x := x + 1;]3
```

$$\text{IntEntry}(1) = [-\infty, \infty]$$

$$\text{IntExit}(1) = [1, 1]$$

$$\text{IntEntry}(2) = \text{IntExit}(2) \Delta (\text{IntExit}(1) \sqcup \text{IntExit}(3))$$

$$\text{IntExit}(2) = \text{IntEntry}(2)$$

$$\text{IntEntry}(3) = \text{IntExit}(2) \sqcap [-\infty, 1000]$$

$$\text{IntExit}(3) = \text{IntEntry}(3) + [1, 1]$$

$$\text{IntEntry}(4) = \text{IntExit}(2) \sqcap [1001, \infty]$$

$$\text{IntExit}(4) = \text{IntEntry}(4)$$

# Non Monotonicity of Widening

- ◆  $[0,1] \nabla [0,2] = [0, \infty]$
- ◆  $[0,2] \nabla [0,2] = [0,2]$

# Widening and Narrowing Summary

- ◆ Very simple but produces impressive precision
- ◆ Sometimes non-monotonic
- ◆ The McCarthy 91 function  
int f(x)  $[-\infty, \infty]$   
if  $x > 100$   
then  $[101, \infty]$  return  $x - 10$   $[91, \infty - 10]$ ;  
else  $[-\infty, 100]$  return  $f(f(x+11))$   $[91, 91]$  ;
- ◆ Also useful in the finite case
- ◆ Can be used as a methodological tool

# Foundation of Static Analysis

- ◆ Static analysis can be viewed as interpreting the program over an “abstract domain”
- ◆ Execute the program over larger set of execution paths
- ◆ Guarantee sound results
  - Every identified constant is indeed a constant
  - But not every constant is identified as such

# Abstract Interpretation

# Odd/Even Abstract Interpretation

# Odd/Even Abstract Interpretation

# Odd/Even Abstract Interpretation

# Galois Connections

- ◆ A concrete domain  $(C, \sqsubseteq)$
- ◆ An abstract domain  $(A, \sqsubseteq)$
- ◆ An **abstraction** function  $\alpha: C \rightarrow A$
- ◆ A **concretization** function  $\gamma: A \rightarrow C$
- ◆  $\alpha$  is monotone (order-preserving)
- ◆  $\gamma$  is monotone (order-preserving)
- ◆  $c \sqsubseteq \gamma(\alpha(c))$
- ◆  $\alpha(\gamma(a)) \sqsubseteq a$
- ◆  $\alpha(c) \sqsubseteq a \Leftrightarrow c \sqsubseteq \gamma(a)$

# More on Galois Connections

- ◆  $\alpha$  and  $\gamma$  determine each other
- ◆ Defines an upward closure operator  $\text{up}: C \rightarrow C$  such that  $c \sqsubseteq \text{up}(c)$  and  $\text{up}(\text{up}(c)) = \text{up}(c)$  by  $\text{up}(c) = \gamma(\alpha(c))$
- ◆ For  $C = P(\Sigma)$  let  $\beta: C \rightarrow A$  then the Galois connection is defined by:
  - $\alpha(c) = \sqcup \{ \beta(\sigma) \mid \sigma \in c \}$
  - $\gamma(a) = \{ \sigma \mid \beta(\sigma) \sqsubseteq a \}$

# The Abstraction Function (CP)

◆ Map collecting states into constants

◆ The abstraction of an individual state

$$\beta_{\text{CP}}: [\text{Var}_* \rightarrow \mathbb{Z}] \rightarrow [\text{Var}_* \rightarrow \mathbb{Z} \cup \{\perp, \top\}]$$

$$\beta_{\text{CP}}(\sigma) = \sigma$$

◆ The abstraction of set of states

$$\alpha_{\text{CP}}: \mathcal{P}([\text{Var}_* \rightarrow \mathbb{Z}]) \rightarrow [\text{Var}_* \rightarrow \mathbb{Z} \cup \{\perp, \top\}]$$

$$\alpha_{\text{CP}}(\text{CS}) = \sqcup \{ \beta_{\text{CP}}(\sigma) \mid \sigma \in \text{CS} \} = \sqcup \{ \sigma \mid \sigma \in \text{CS} \}$$

◆ Soundness

$$\alpha_{\text{CP}}(\text{Reach}(v)) \sqsubseteq \text{df}(v)$$

◆ Completeness

# The Concretization Function

- ◆ Map constants into collecting states

- ◆ The formal meaning of constants

- ◆ The concretization

$$\gamma_{\text{CP}}: [\text{Var}_* \rightarrow Z \cup \{\perp, \tau\}] \rightarrow \mathcal{P}([\text{Var}_* \rightarrow Z])$$

$$\gamma_{\text{CP}}(\text{df}) = \{\sigma \mid \beta_{\text{CP}}(\sigma) \sqsubseteq \text{df}\} = \{\sigma \mid \sigma \sqsubseteq \text{df}\}$$

- ◆ Soundness

$$\text{Reach}(v) \subseteq \gamma_{\text{CP}}(\text{df}(v))$$

- ◆ Optimality

# Galois Connection Constant Propagation

- ◆  $\alpha_{CP}$  is monotone
- ◆  $\gamma_{CP}$  is monotone
- ◆  $\forall df \in [\text{Var}_* \rightarrow \mathbf{Z} \cup \{\perp, \top\}]$ 
  - $\alpha_{CP}(\gamma_{CP}(df)) \sqsubseteq df$
- ◆  $\forall c \in \mathbf{P}([\text{Var}_* \rightarrow \mathbf{Z}])$ 
  - $c_{CP} \sqsubseteq \gamma_{CP}(\alpha_{CP}(C))$

# Upper Closure (CP)

# More Examples

- ◆ Interval Analysis
- ◆ Points-to analysis
- ◆ Reaching definitions
- ◆ Live variable analysis

# Collecting Semantics

- ◆ The input state is not known at compile-time
- ◆ “Collect” all the states for all possible inputs to the program
- ◆ The set of reachable states
- ◆ No lost of precision
- ◆ Need not be computable

# A Simple Example Program

$\{[x \mapsto 0, y \mapsto 0, z \mapsto 0]\}$

$z = 3$

$\{[x \mapsto 0, y \mapsto 0, z \mapsto 3]\}$

$x = 1$

$\{[x \mapsto 1, y \mapsto 0, z \mapsto 3]\}$

while ( $x > 0$ ) (  $\{[x \mapsto 1, y \mapsto 0, z \mapsto 3], [x \mapsto 3, y \mapsto 0, z \mapsto 3],$

if ( $x = 1$ ) then  $y = 7$

$\{[x \mapsto 1, y \mapsto 7, z \mapsto 3], [x \mapsto 3, y \mapsto 7, z \mapsto 3]\}$

else  $y = z + 4$

$x = 3$   $\{[x \mapsto 1, y \mapsto 7, z \mapsto 3], [x \mapsto 3, y \mapsto 7, z \mapsto 3]\}$

print  $y$   $\{[x \mapsto 3, y \mapsto 7, z \mapsto 3]\}$

)  $\{[x \mapsto 3, y \mapsto 7, z \mapsto 3]\}$

# Another Example

$\{[x \mapsto 0]\}$

while (true) do

$\{[x \mapsto 0], \{[x \mapsto 1], \{[x \mapsto 2], \dots\}\}$

$x = x + 1$

$\{\{[x \mapsto 1], \{[x \mapsto 2], \dots\}\}$

# Global Soundness Theorem

- ◆ If the meaning of every statement is locally sound
- ◆ Then, the solution computed by the iterative algorithm overapproximates the collecting semantics
  - $\alpha(\text{CS}) \sqsupseteq \text{df}$
  - $\text{CS} \sqsupseteq \gamma(\text{df})$

# Example

P       $\{[x \mapsto 0]\}$

while (true) do

P       $\{[x \mapsto 0], \{[x \mapsto 1], \{[x \mapsto 2], \dots\}\}$

$x = x + 1$

P       $\{\{[x \mapsto 1], \{[x \mapsto 2], \dots\}\}$

# Bad Example

P       $\{[x \mapsto 0]\}$

$x = x - 1$

?       $\{[x \mapsto -1]\}$

$x = x + 1$

?       $\{[x \mapsto 0]\}$

# An ‘Iterative’ Definition of Collecting Semaics

- ◆ Generate a system of monotone equations
- ◆ The least solution is well-defined
- ◆ The least solution is the collecting interpretation
- ◆ But may not be computable

# Equations Generated for Collecting Interpretation

## ◆ Equations for elementary statements

– [skip]

$$CS_{\text{exit}}(l) = CS_{\text{entry}}(l)$$

– [b]

$$CS_{\text{exit}}(l) = \{\sigma : \sigma \in CS_{\text{entry}}(l), \llbracket b \rrbracket \sigma = \text{tt}\}$$

– [x := a]

$$CS_{\text{exit}}(l) = \{(s[x \mapsto \mathbf{A} \llbracket a \rrbracket s]) \mid s \in CS_{\text{entry}}(l)\}$$

## ◆ Equations for control flow constructs

$CS_{\text{entry}}(l) = \bigcup CS_{\text{exit}}(l')$   $l'$  immediately precedes  $l$  in the control flow graph

## ◆ An equation for the entry

$$CS_{\text{entry}}(l) = \{\sigma \mid \sigma \in \text{Var}_* \rightarrow \mathbf{Z}\}$$

# System of Equations (Collecting Semantics)

$S =$

$$\left\{ \begin{array}{l} \text{CS}_{\text{entry}}[s] = \{\sigma_0\} \\ \text{CS}_{\text{entry}}[v] = \cup \{f(e)(\text{CS}_{\text{entry}}[u]) \mid (u, v) \in E\} \\ \text{where } f(e) = \lambda X. \{ \llbracket \text{st}(e) \rrbracket \sigma \mid \sigma \in X \} \text{ for atomic statements} \\ f(e) = \lambda X. \{ \sigma \mid \llbracket b(e) \rrbracket \sigma = \text{tt} \} \end{array} \right.$$

$$F_S: L^n \rightarrow L^n$$

$$F_S(X)[v] = \cup \{f(e)[u] \mid (u, v) \in E\}$$

$$\text{lfp}(S) = \text{lfp}(F_S)$$

# The Least Solution

- ◆ 2n sets of equations

$$CS_{\text{entry}}(1), \dots, CS_{\text{entry}}(n), CS_{\text{exit}}(1), \dots, CS_{\text{exit}}(n)$$

- ◆ Can be written in vectorial form

$$\overrightarrow{CS} = F_{cs}(\overrightarrow{CS})$$

- ◆ The least solution  $\text{lfp}(F_{cs})$  is well-defined
- ◆ Every component is minimal
- ◆ Since  $F_{cs}$  is monotone such a solution always exists
- ◆  $CS_{\text{entry}}(v) = \{s \mid \exists s_0 \langle P, s_0 \rangle \Rightarrow^* (S', s), \text{init}(S')=v\}$
- ◆ Simplify the soundness criteria

# Example

$[x = 0]^0$

while  $[(\text{true})]^1$  do

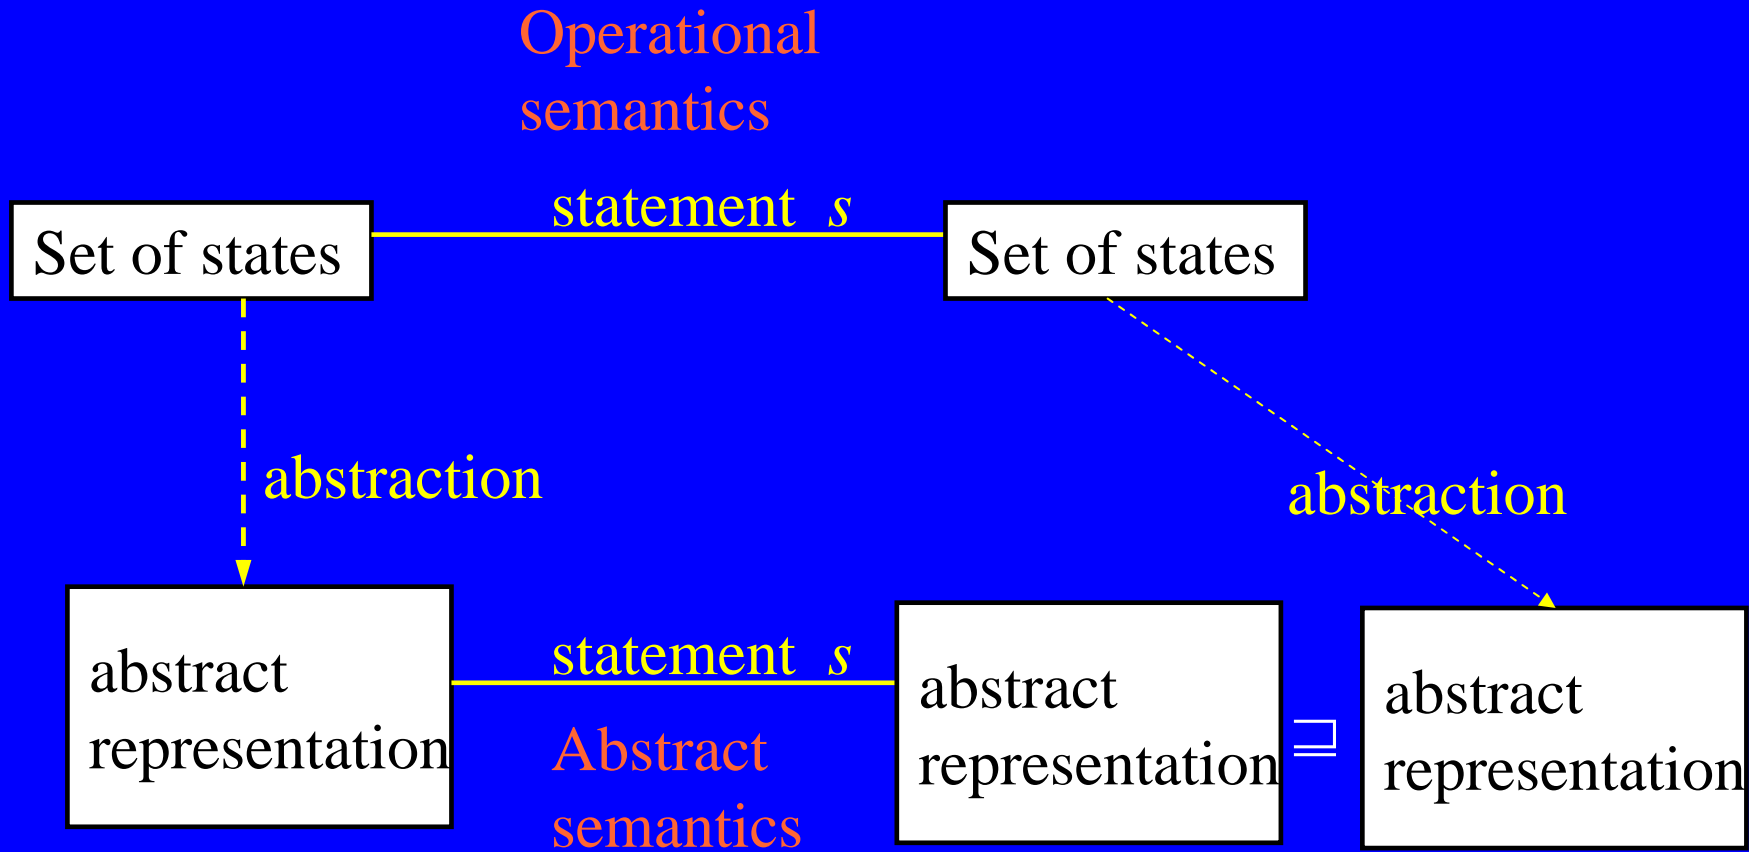

$[x = x + 1]^2$

# A Low Level View

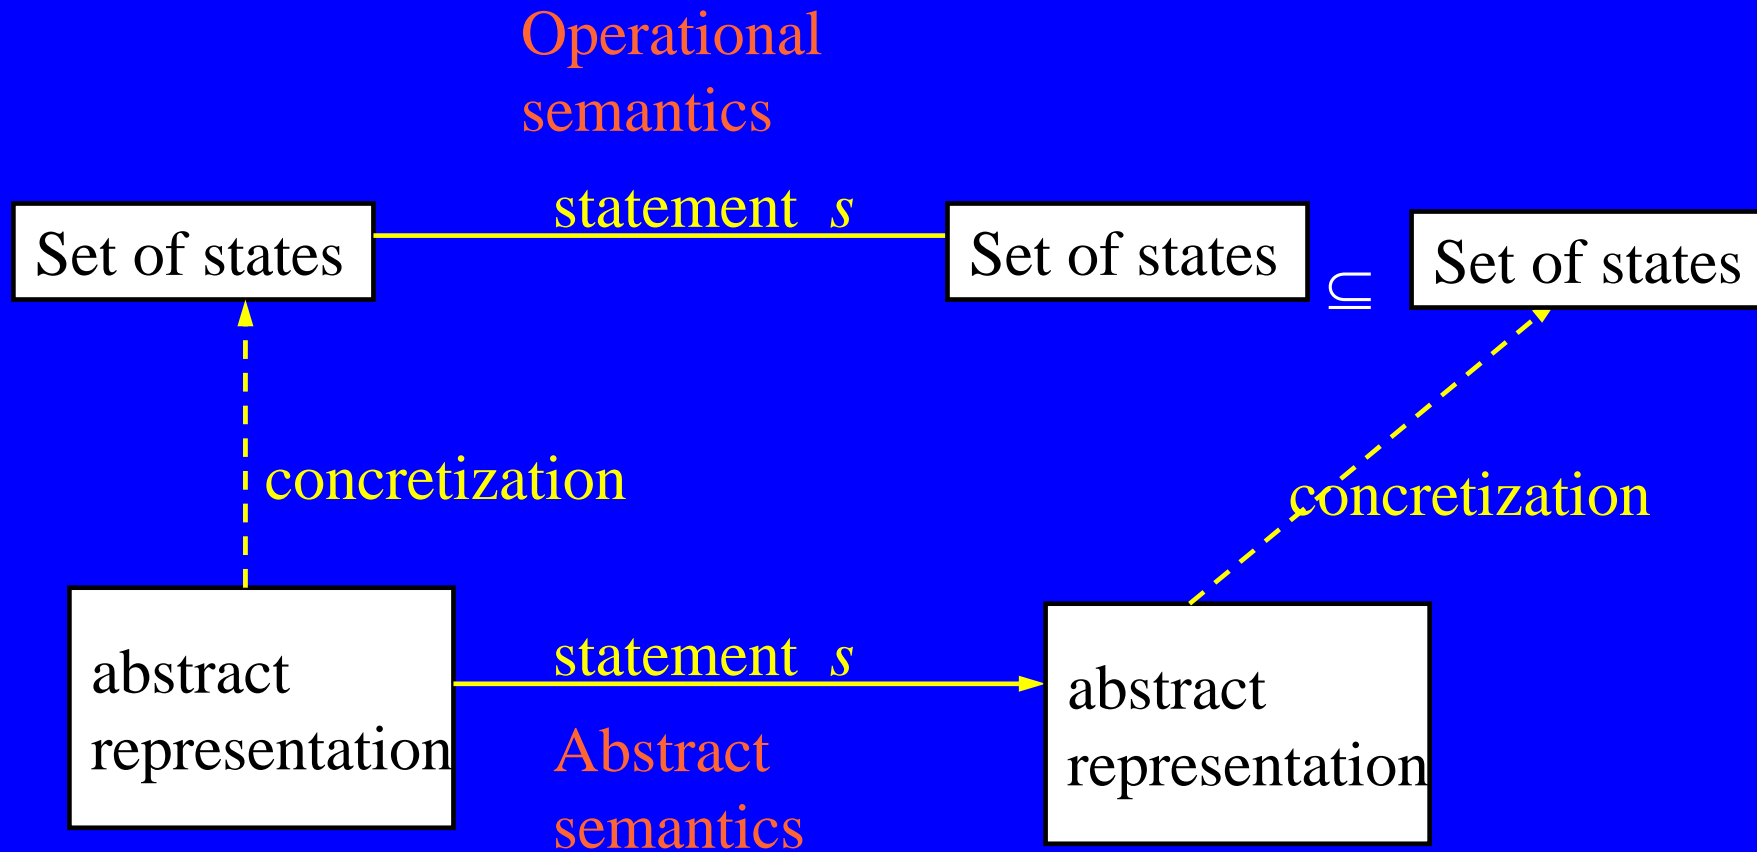

- ◆ An infinite set of states  $\Sigma$  (including control)
- ◆ The meaning of the program (small step) is a transition relation  $\tau \subseteq \Sigma \times \Sigma$
- ◆ Let  $\Sigma_s$  be the set of initial states
- ◆ The collecting interpretation system  
$$F(\text{CS}) = \Sigma_s \cup \{ \sigma \mid \exists \sigma' : \sigma' \in \text{CS} \wedge \sigma' \rightarrow_{\tau} \sigma \}$$
- ◆ Let  $A$  be an abstract domain (lattice)
- ◆ Let  $a_s \in A$  be the initial abstract element
- ◆ Let  $\gamma: A \rightarrow P(\Sigma)$  be the concretization
- ◆ The abstract meaning of the program (small step) is a transition relation  $\tau^{\#} \subseteq A \times A$
- ◆ Local soundness:
- ◆ Global soundness:

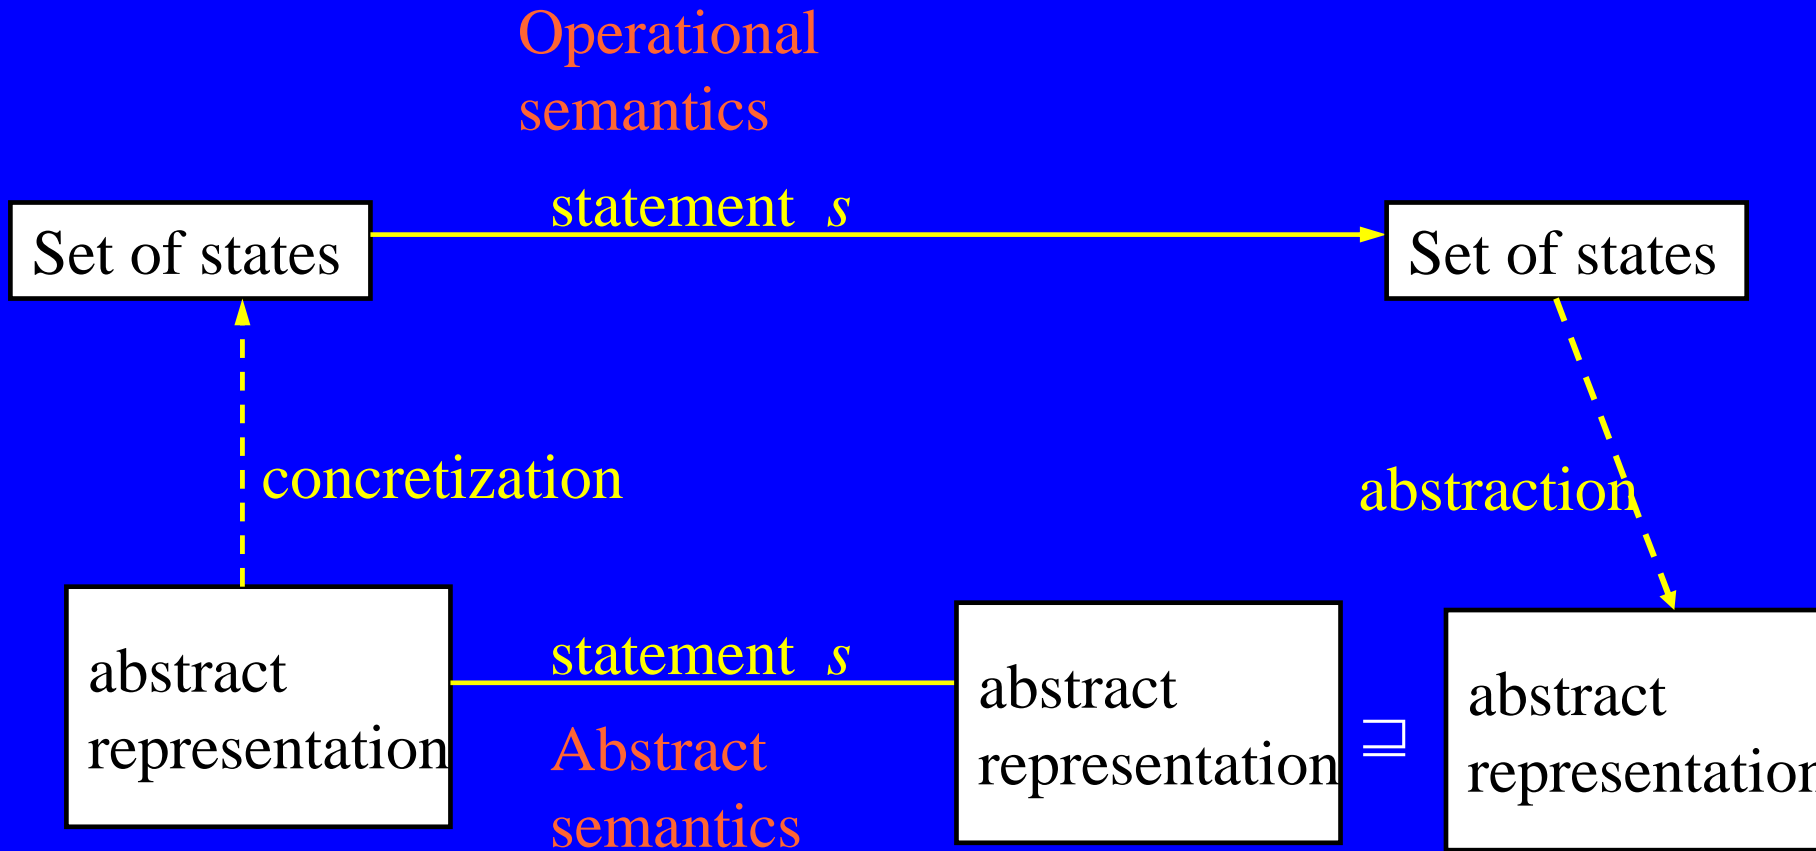

# Abstract (Conservative) interpretation

# Abstract (Conservative) interpretation

# Abstract (Conservative) interpretation

# Soundness Theorem(1)

1. Let  $(\alpha, \gamma)$  form **Galois connection** from  $C$  to  $A$
2.  $f: C \rightarrow C$  be a monotone function
3.  $f^\# : A \rightarrow A$  be a monotone function
4.  $\forall a \in A: f(\gamma(a)) \sqsubseteq \gamma(f^\#(a))$

$$\text{lfp}(f) \sqsubseteq \gamma(\text{lfp}(f^\#))$$

$$\alpha(\text{lfp}(f)) \sqsubseteq \text{lfp}(f^\#)$$

# Soundness Theorem(2)

1. Let  $(\alpha, \gamma)$  form **Galois connection** from  $C$  to  $A$
2.  $f: C \rightarrow C$  be a monotone function
3.  $f^\#: A \rightarrow A$  be a monotone function
4.  $\forall c \in C: \alpha(f(c)) \sqsubseteq f^\#(\alpha(c))$

$$\alpha(\text{lfp}(f)) \sqsubseteq \text{lfp}(f^\#)$$

$$\text{lfp}(f) \sqsubseteq \gamma(\text{lfp}(f^\#))$$

# Soundness Theorem(3)

1. Let  $(\alpha, \gamma)$  form **Galois connection** from  $C$  to  $A$
2.  $f: C \rightarrow C$  be a monotone function
3.  $f^\#: A \rightarrow A$  be a monotone function
4.  $\forall a \in A: \alpha(f(\gamma(a))) \sqsubseteq f^\#(a)$

$$\alpha(\text{lfp}(f)) \sqsubseteq \text{lfp}(f^\#)$$

$$\text{lfp}(f) \sqsubseteq \gamma(\text{lfp}(f^\#))$$

# Local Concrete Semantics

- ◆ For every atomic statement  $S$ 
  - $\llbracket S \rrbracket : [\text{Var}_* \rightarrow Z] \rightarrow [\text{Var}_* \rightarrow Z]$
  - $\llbracket x := a \rrbracket s = s[x \mapsto \mathbf{A}\llbracket a \rrbracket s]$
  - $\llbracket \text{skip} \rrbracket s = s$
- ◆ For Boolean conditions ...

# Local Abstract Semantics(CP)

- ◆ For every atomic statement  $S$ 
  - $\llbracket S \rrbracket^\# : \text{Var}_* \rightarrow L \rightarrow \text{Var}_* \rightarrow L$
  - $\llbracket x := a \rrbracket^\#(e) = e [x \mapsto \llbracket a \rrbracket^\#(e)]$
  - $\llbracket \text{skip} \rrbracket^\#(e) = e$
- ◆ For Booleans ...

# Local Soundness (CP)

◆ For every atomic statement  $S$  show one of the following

- $\alpha_{\text{CP}}(\{\llbracket S \rrbracket \sigma \mid \sigma \in \text{CS}\}) \sqsubseteq \llbracket S \rrbracket^{\#}(\alpha_{\text{CP}}(\text{CS}))$
- $\{\llbracket S \rrbracket \sigma \mid \sigma \in \gamma_{\text{CP}}(\text{df})\} \subseteq \gamma_{\text{CP}}(\llbracket S \rrbracket^{\#}(\text{df}))$
- $\alpha(\{\llbracket S \rrbracket \sigma \mid \sigma \in \gamma_{\text{CP}}(\text{df})\}) \sqsubseteq \llbracket S \rrbracket^{\#}(\text{df})$

◆ The above condition implies global soundness  
[Cousot & Cousot 1976]

$$\alpha(\text{CS}_{\text{entry}}(1)) \sqsubseteq \text{df}_{\text{entry}}(1)$$
$$\text{CS}_{\text{entry}}(1) \subseteq \gamma(\text{df}_{\text{entry}}(1))$$

# Lemma 1

Consider a lattice  $L$ .

$f: L \rightarrow L$  is monotone iff

$$\text{for all } X \subseteq L: \sqcup \{f(z) \mid z \in X\} \sqsubseteq f(\sqcup \{z \mid z \in X\})$$

# Assignments in constant propagation

## ◆ Monotone

$$- df_1 \sqsubseteq df_2 \rightarrow \llbracket x := e \rrbracket^\#(df_1) \sqsubseteq \llbracket x := e \rrbracket^\#(df_2)$$

## ◆ Local Soundness

$$- \alpha(\{\llbracket x := e \rrbracket \sigma \mid \sigma \in CS\}) \sqsubseteq \llbracket x := e \rrbracket^\#(\alpha(CS))$$

# Proof of Soundness (Summary)

- ◆ Define an “appropriate” operational semantics
- ◆ Define “collecting” operational semantics
- ◆ Establish a Galois connection between collecting states and abstract states
- ◆ (Local correctness) Show that the abstract interpretation of every atomic statement is **sound** w.r.t. the collecting semantics
- ◆ (Global correctness) Conclude that the result of the iterative analysis is sound w.r.t. the collecting semantics
- ◆ Can be applied between different abstractions

# Induced Analysis (Relatively Optimal)

- ◆ It is sometimes possible to show that a given analysis is not only sound but optimal w.r.t. the chosen abstraction
  - but not necessarily optimal!
- ◆ Define
$$\llbracket S \rrbracket^\# (df) = \alpha(\{\llbracket S \rrbracket \sigma \mid \sigma \in \gamma(df)\})$$
- ◆ But this  $\llbracket S \rrbracket^\#$  may not be computable
- ◆ Derive (at compiler-generation time) an alternative form for  $\llbracket S \rrbracket^\#$
- ◆ A useful measure to decide if the abstraction must lead to overly imprecise results

# Notions of precision

- ◆  $CS = \gamma$  (df)
- ◆  $\alpha(CS) = df$
- ◆ Meet(Join) over all paths
- ◆ Using best transformers
- ◆ Good enough

# Conclusions

- ◆ Abstract interpretation relates runtime semantics and static information
- ◆ The concrete semantics serves as a tool in designing abstractions
- ◆ Understanding concretization is a must
- ◆ Understand what is preserved/lost
