Register Allocation

Mooly Sagiv

html://www.cs.tau.ac.il/~msagiv/courses/wcc11-12.html

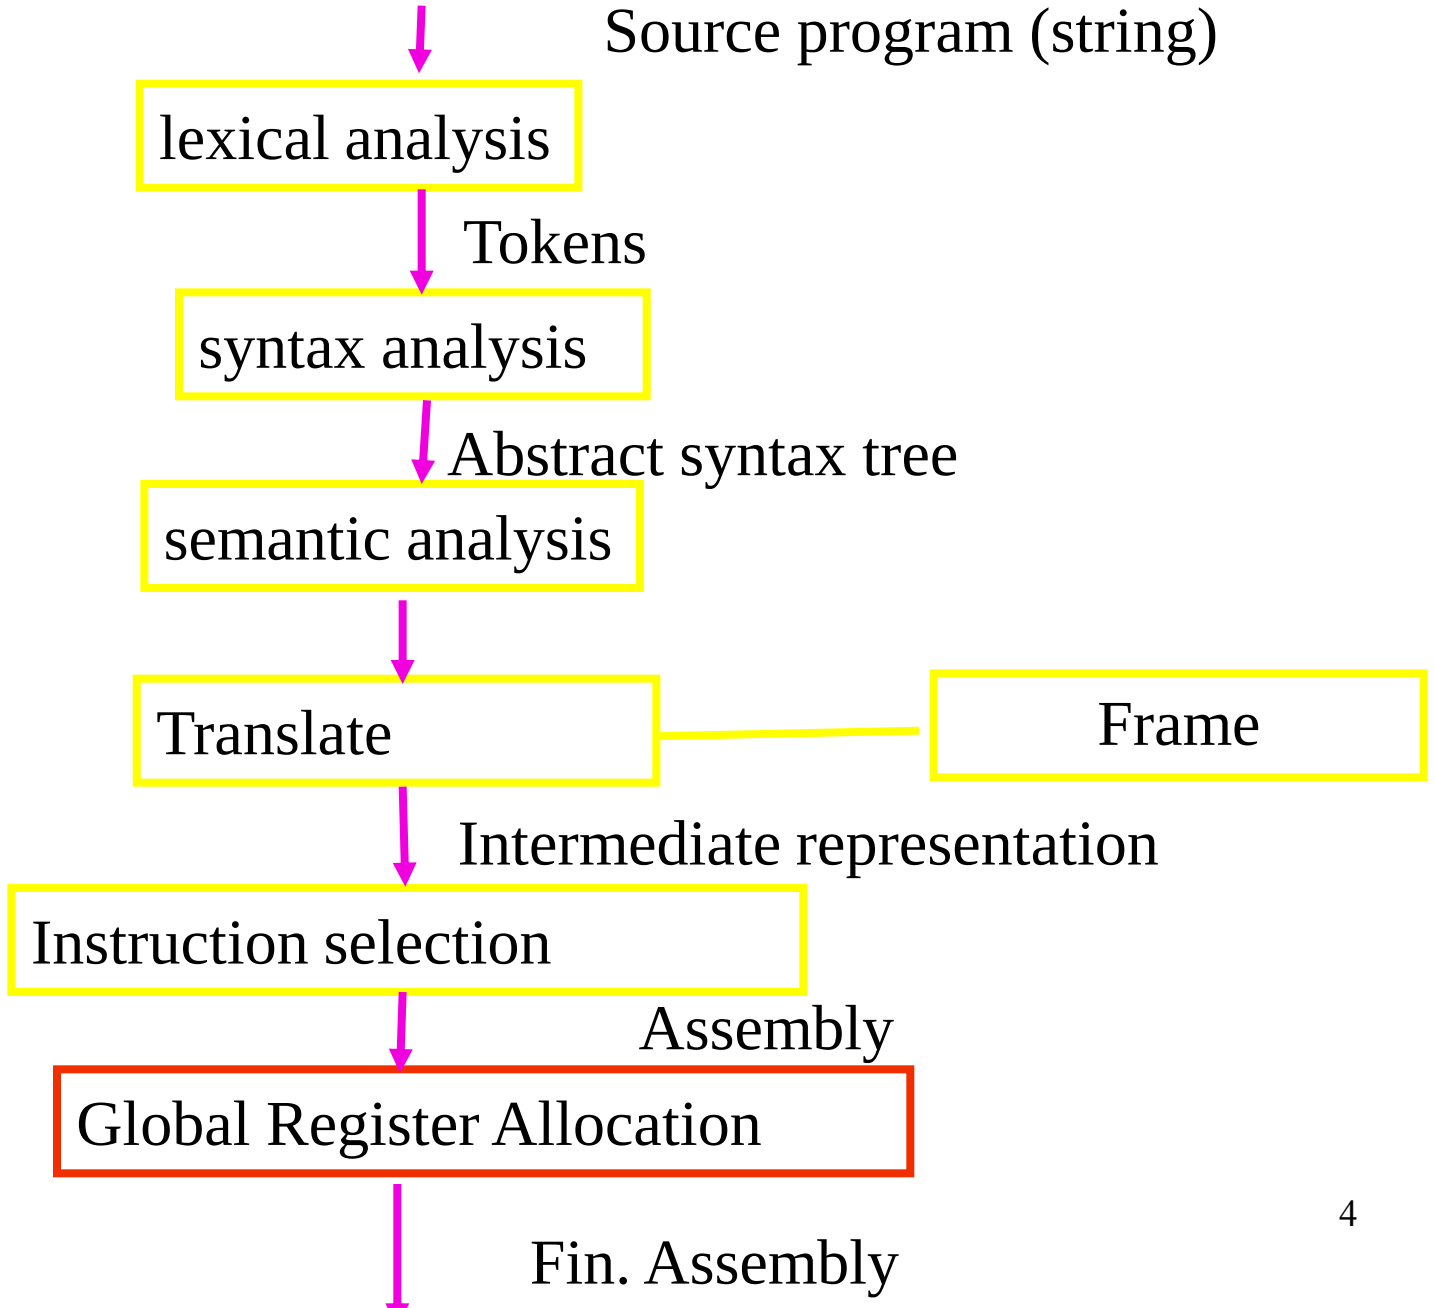
Two Phase Solution
Dynamic Programming
Sethi & Ullman

- Bottom-up (labeling)
  - Compute for every subtree
    - The minimal number of registers needed (weight)
- Top-Down
  - Generate the code using labeling by preferring "heavier" subtrees (larger labeling)

“Global” Register Allocation

- Input:
  - Sequence of machine code instructions (assembly)
    - Unbounded number of temporary registers
- Output
  - Sequence of machine code instructions (assembly)
  - Machine registers
  - Some MOVE instructions removed
  - Missing prologue and epilogue

Basic Compiler Phases



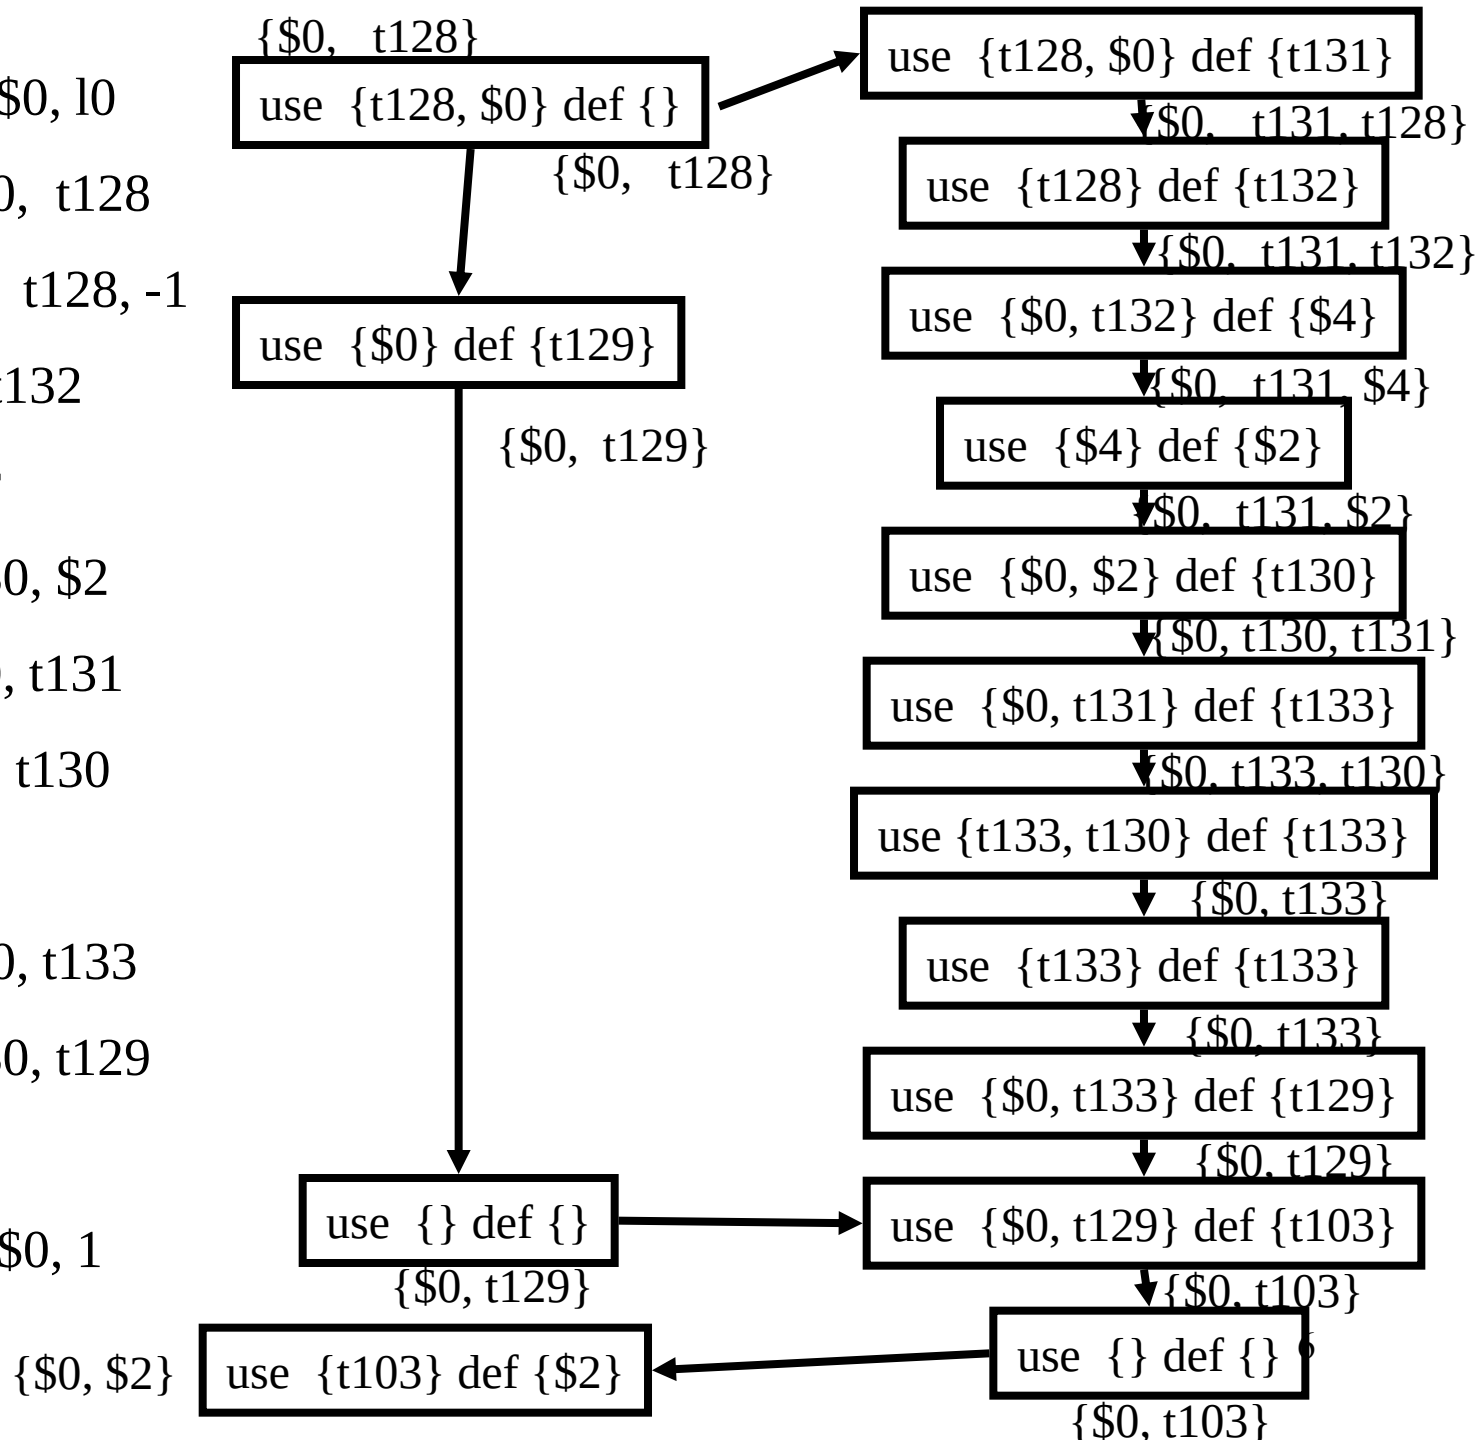
Global Register Allocation Process

Repeat

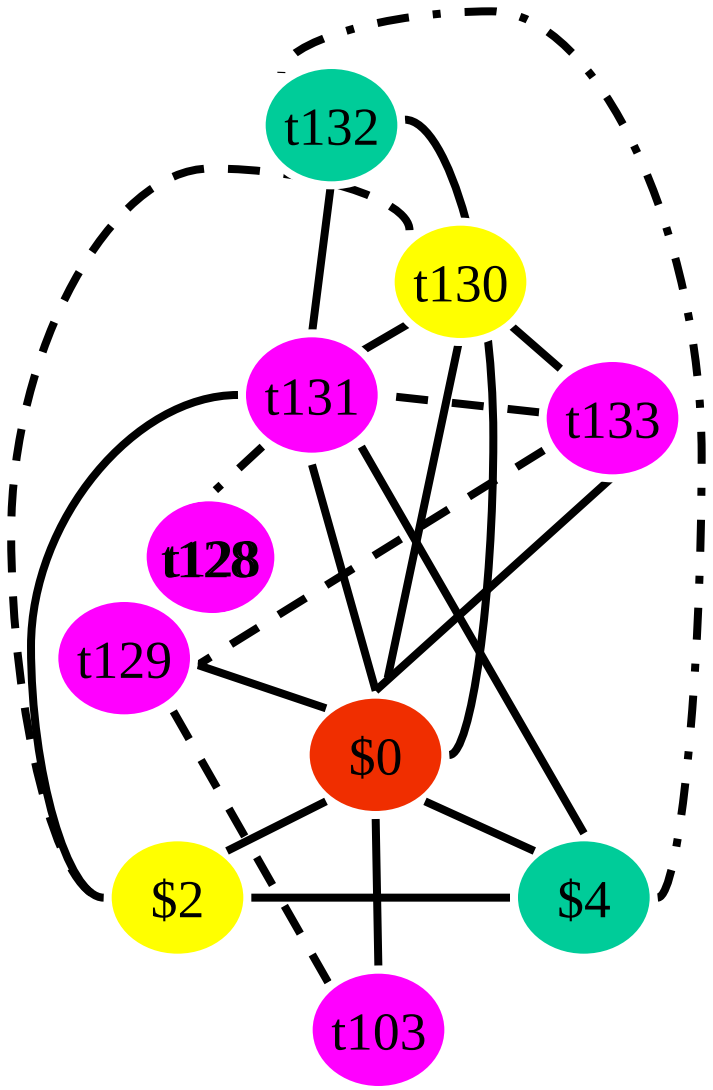
- Construct the interference graph
- Color graph nodes with machine registers
  - Adjacent nodes are not colored by the same register
- Spill a temporary into memory

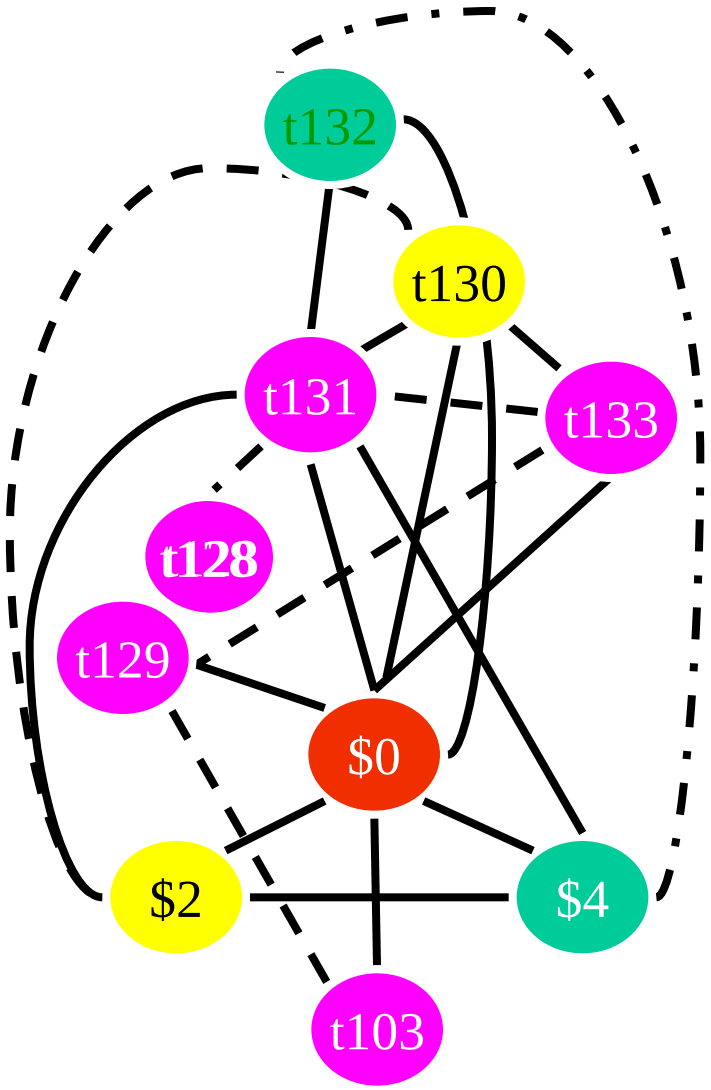
Until no more spill

```
l3:     beq  t128, $0, l0
l1:     or  t131, $0,  t128
        addi  t132,  t128, -1
        or $4, $0, t132
        jal  nfactor
        or  t130,  $0, $2
        or t133, $0, t131
        mult  t133, t130
        mflo t133
        or  t129, $0, t133
l2:     or  t103,  $0, t129
        b  lend
l0:     addi t129, $0, 1
        b l2
```



```
l3:     beq  t128, $0, l0 /* $0, t128 */
l1:     or  t131, $0,  t128 /* $0, t128, t131 */
        addi  t132,  t128, -1 /* $0, t131, t132 */
        or $4, $0, t132  /* $0, $4, t131 */
        jal  nfactor     /* $0, $2, t131 */
        or  t130,  $0, $2  /* $0, t130, t131 */
        or t133, $0, t131 /* $0, t130, t133 */
        mult  t133, t130 /* $0, t133 */
        mflo t133   /* $0, t133 */
        or  t129, $0, t133  /* $0, t129 */
l2:     or  t103,  $0, t129  /* $0, t103 */
        b  lend  /* $0, t103 */
l0:     addi t129, $0, 1    /* $0, t129 */
        b l2    /* $0, t129 */
```





```
l3:     beq  t128  $0  l0
l1:     or  t131  $0   t128
        addi  t132,  t128  -1
        or $4  $0  t132
        jal  nfactor
        or  t130   $0  $2
        or t133  $0  t131
        mult  t133  t130
        mflo t133
        or  t129  $0  t133
l2:     or  t103   $0  t129
        b  lend
l0:     addi t129  $0, 1
        b l2
```

Challenges

- The Coloring problem is computationally hard
- The number of machine registers may be small
- Avoid too many MOVEs
- Handle “pre-colored” nodes

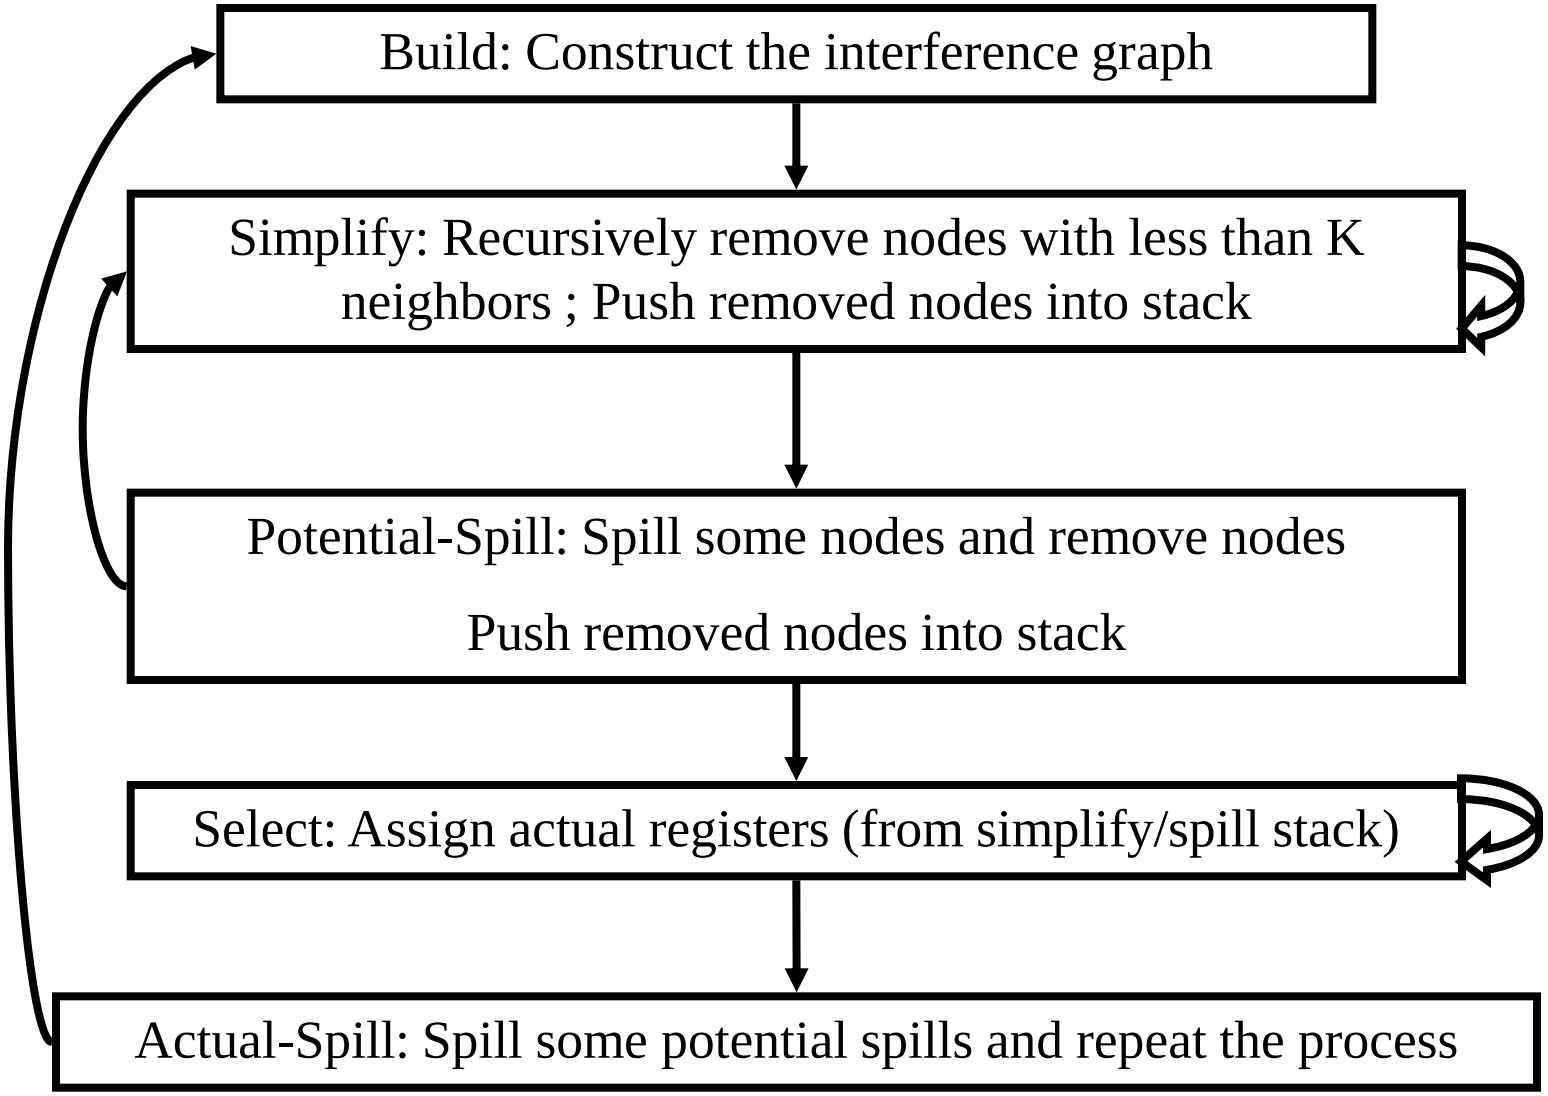
Theorem [Kempe 1879]

- Assume:
  - An undirected graph G(V, E)
  - A node v $\in$V with less than K neighbors
  - G – {v} is K colorable
- Then, G is K colorable

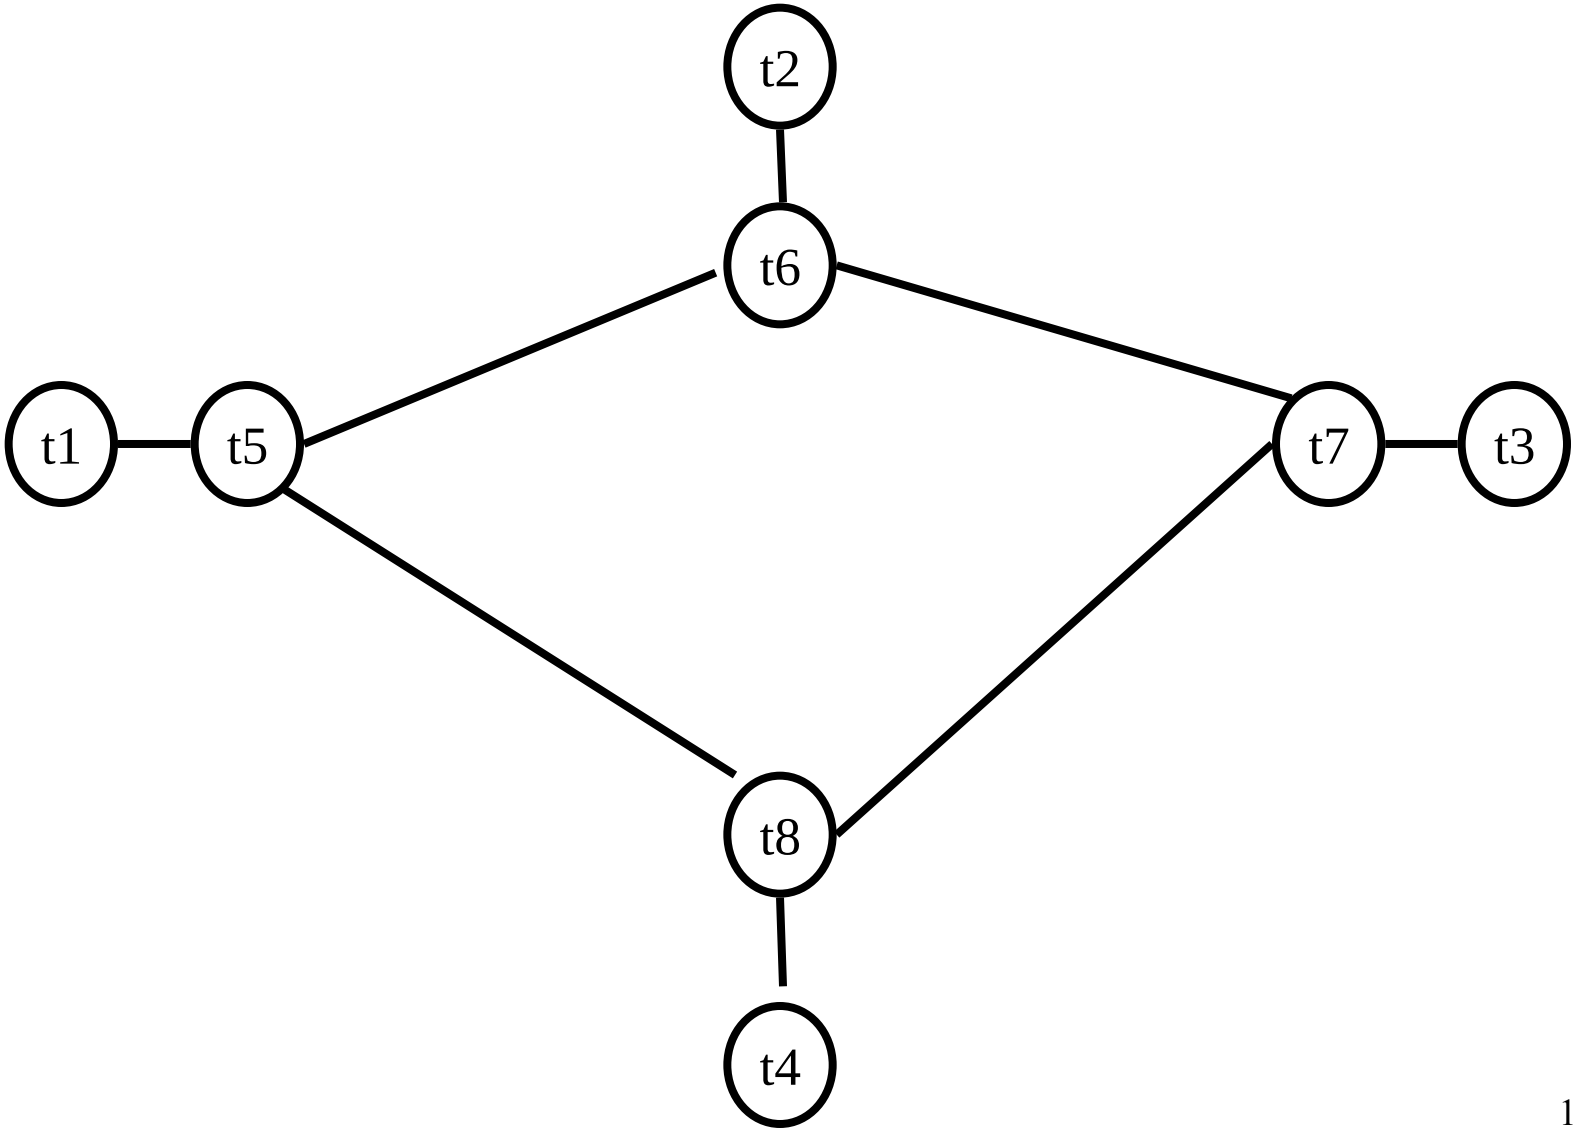
Coloring by Simplification [Kempe 1879]

- K
  - the number of machine registers
- G(V, E)
  - the interference graph
- Consider a node v $\in$ V with less than K neighbors:
  - Color G – v in K colors
  - Color v in a color different than its (colored) neighbors

Graph Coloring by Simplification



Artificial Example K=2



Coalescing

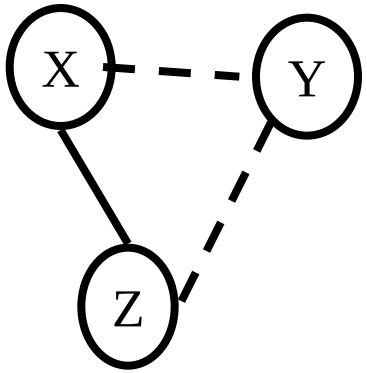
- MOVs can be removed if the source and the target share the same register
- The source and the target of the move can be merged into a single node
  (unifying the sets of neighbors)
- May require more registers
- Conservative Coalescing
  - Merge nodes only if the resulting node has fewer than K neighbors with degree $\geqslant$ K (in the resulting graph)

Constrained Moves

- A instruction T ← S is constrained
  - if S and T interfere
- May happen after coalescing

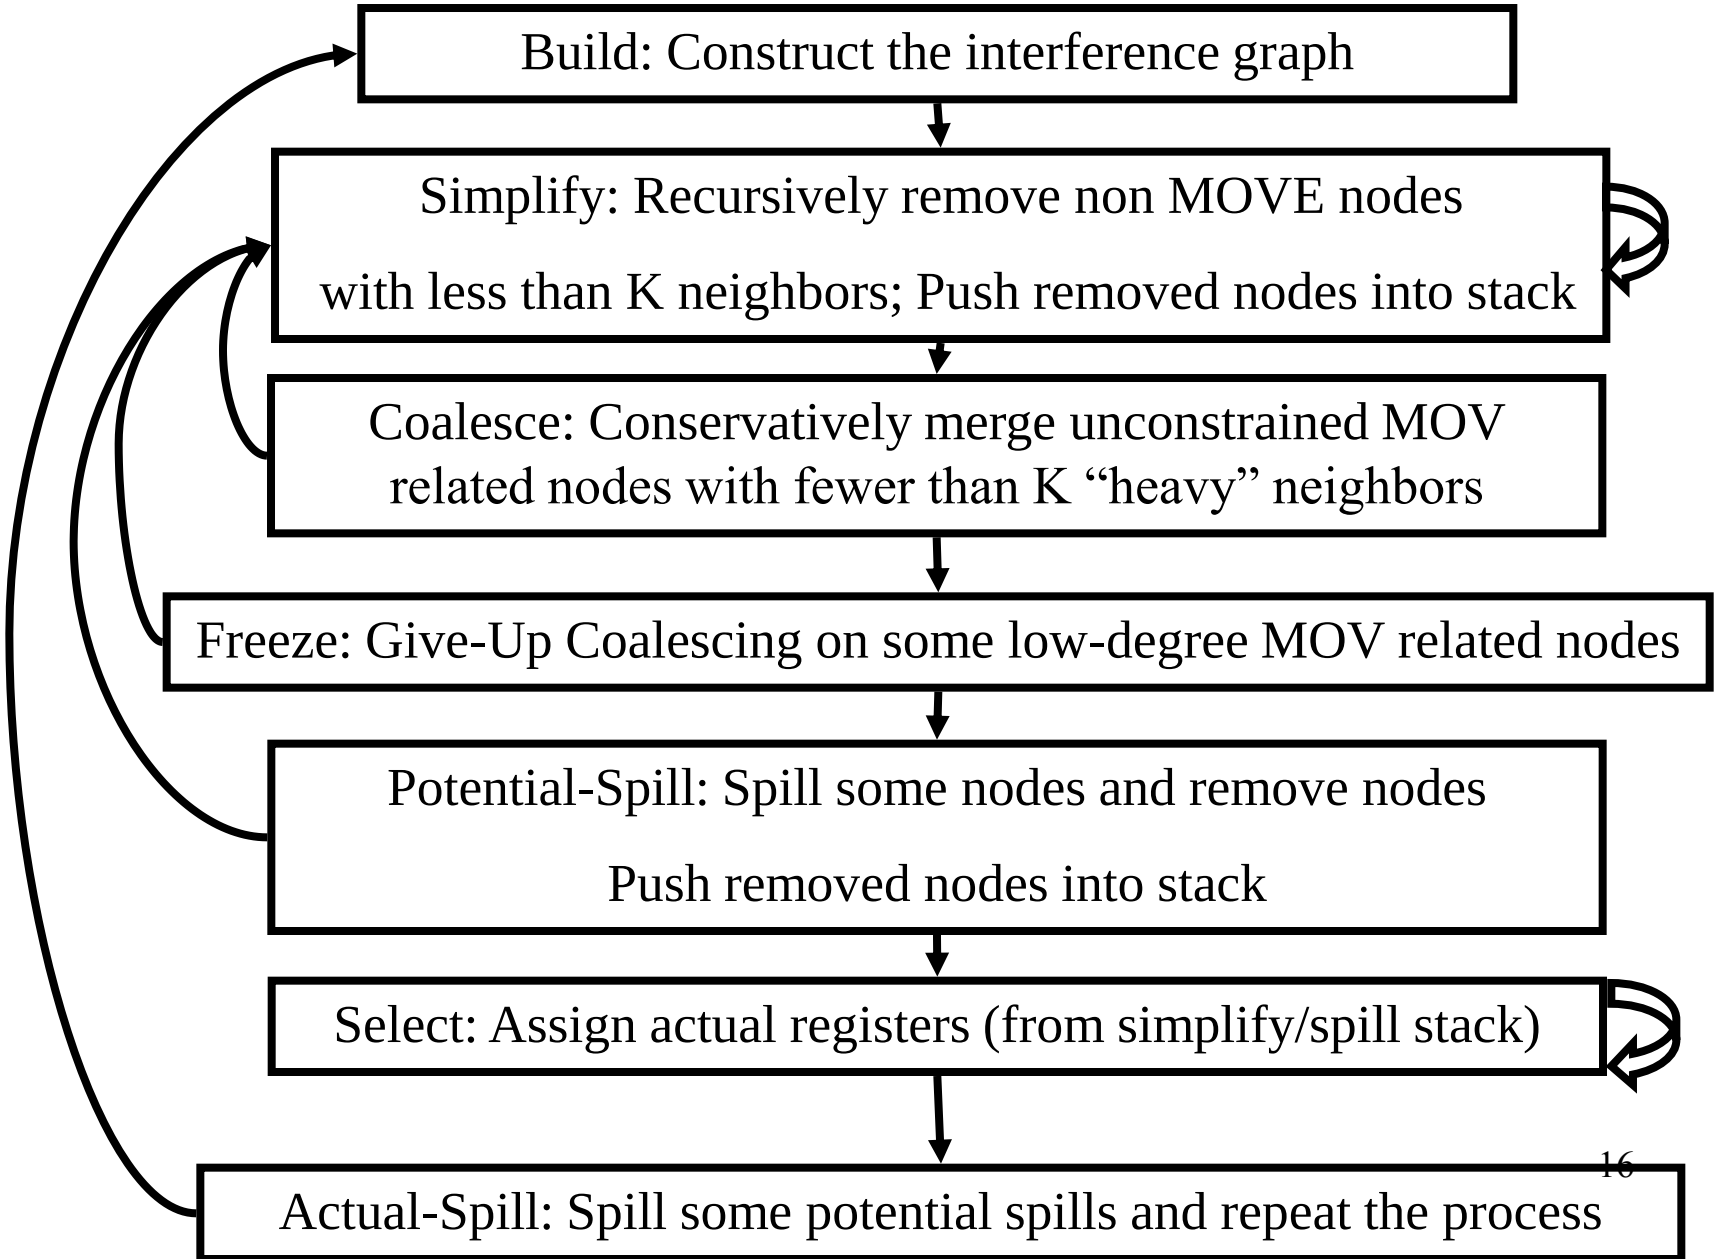
X ←Y /* X, Y, Z */

Y←Z



- Constrained MOVs are not coalesced

Graph Coloring with Coalescing



Spilling

- Many heuristics exist
  - Maximal degree
  - Live-ranges
  - Number of uses in loops
- The whole process need to be repeated after an actual spill

Pre-Colored Nodes

- Some registers in the intermediate language are pre-colored:
  - correspond to real registers
    (stack-pointer, frame-pointer, parameters,)
- Cannot be Simplified, Coalesced, or Spilled (infinite degree)
- Interfered with each other
- But normal temporaries can be coalesced into pre-colored registers
- Register allocation is completed when all the nodes are pre-colored

Caller-Save and Callee-Save Registers

- callee-save-registers (MIPS 16-23)
  - Saved by the callee when modified
  - Values are automatically preserved across calls
- caller-save-registers
  - Saved by the caller when needed
  - Values are not automatically preserved
- Usually the architecture defines caller-save and callee-save registers
  - Separate compilation
  - Interoperability between code produced by different compilers/languages
- But compilers can decide when to use calller/callee registers

Caller-Save vs. Callee-Save Registers

```
int foo(int a)      {
        int b=a+1;
        f1();
        g1(b);
        return(b+2);
 }
```

```
void bar (int y) {
        int x=y+1;
        f2(y);
        g2(2);
}
```

Saving Callee-Save Registers

enter: def(r_7)

…

exit: use(r_7)

enter: def(r_7)

$t_{231} \leftarrow r_7$

…

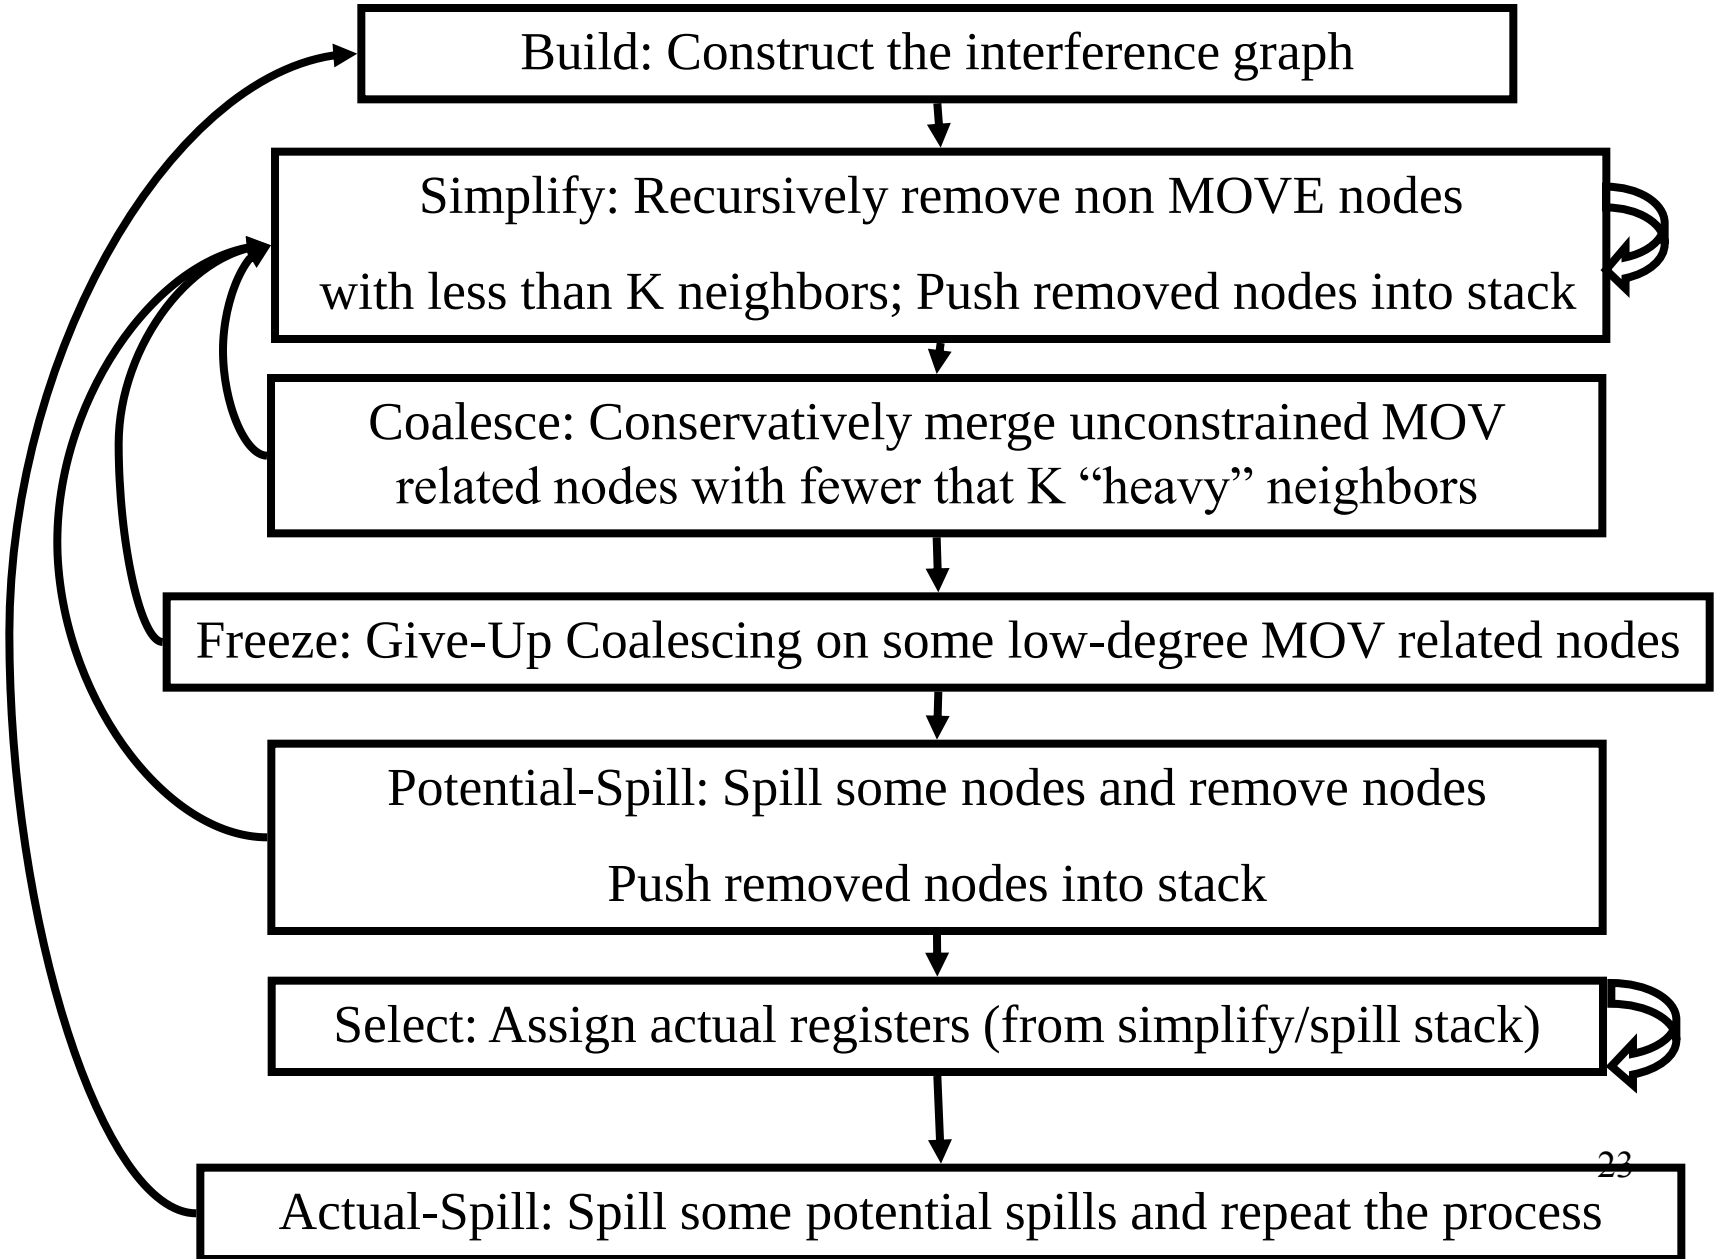
$r_7 \leftarrow t_{231}$

exit: use(r_7)

A Complete Example

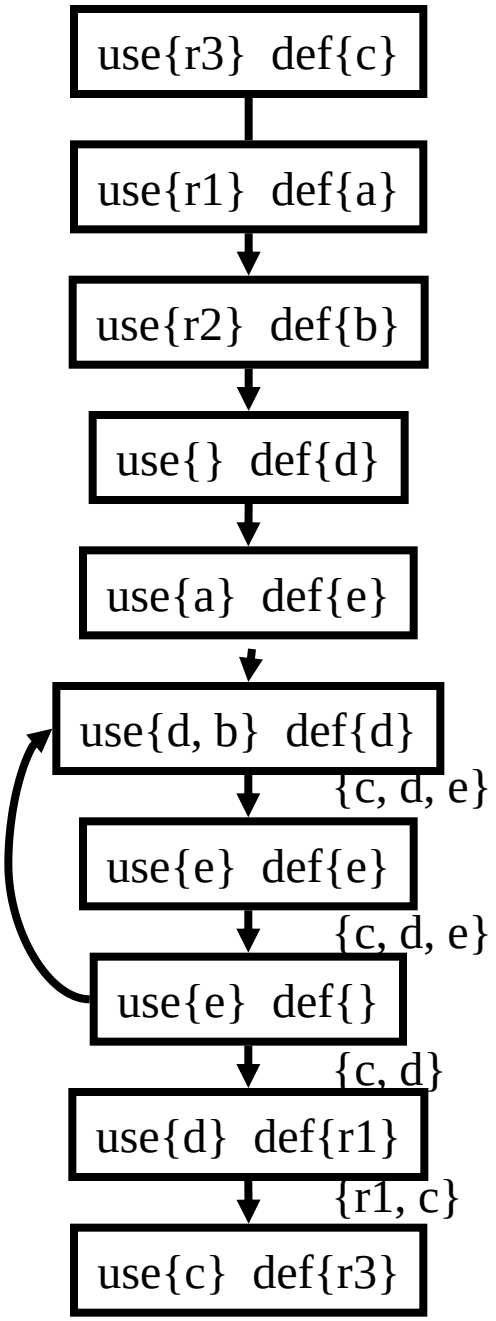
```
enter:
        c := r3     r1, r2   caller save
        a := r1     r3       callee-save
        b := r2
        d := 0
        e := a
loop:
        d := d+b
        e := e-1
        if e>0 goto loop
        r1 := d
        r3 := c
  return  /* r1,r3 */
```

Graph Coloring with Coalescing



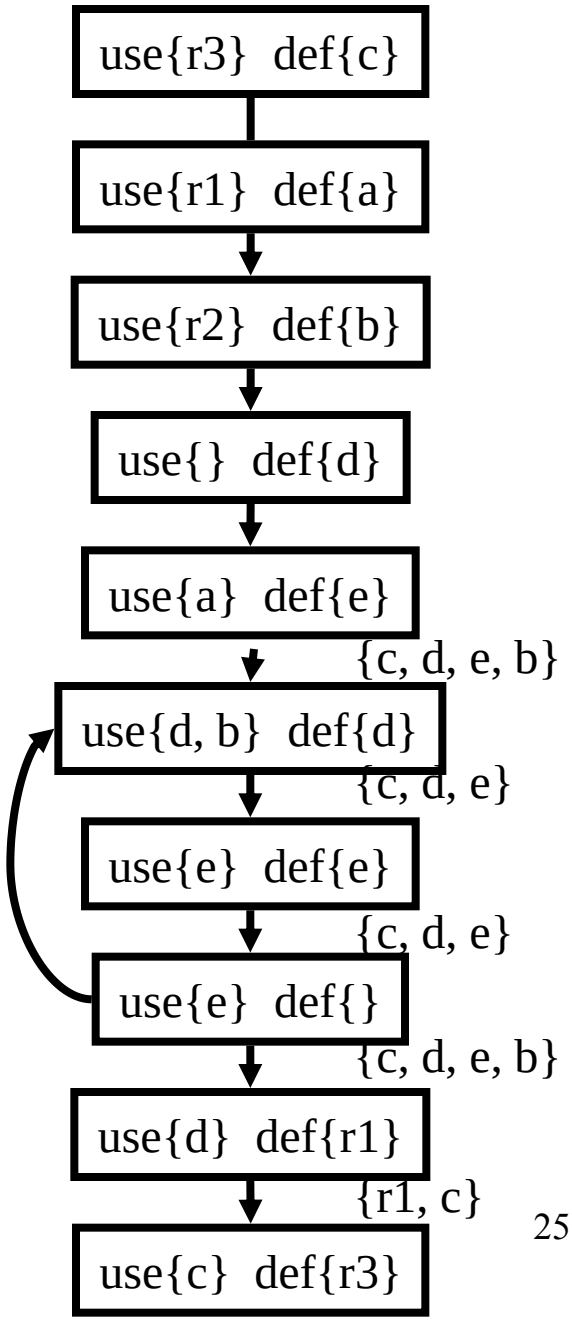
A Complete Example

```
enter:
        c := r3      r1, r2   caller save
        a := r1      r3       callee-save
        b := r2
        d := 0
        e := a
loop:
        d := d+b
        e := e-1
        if e>0 goto loop
        r1 := d
        r3 := c
 return  /* r1,r3 */
```



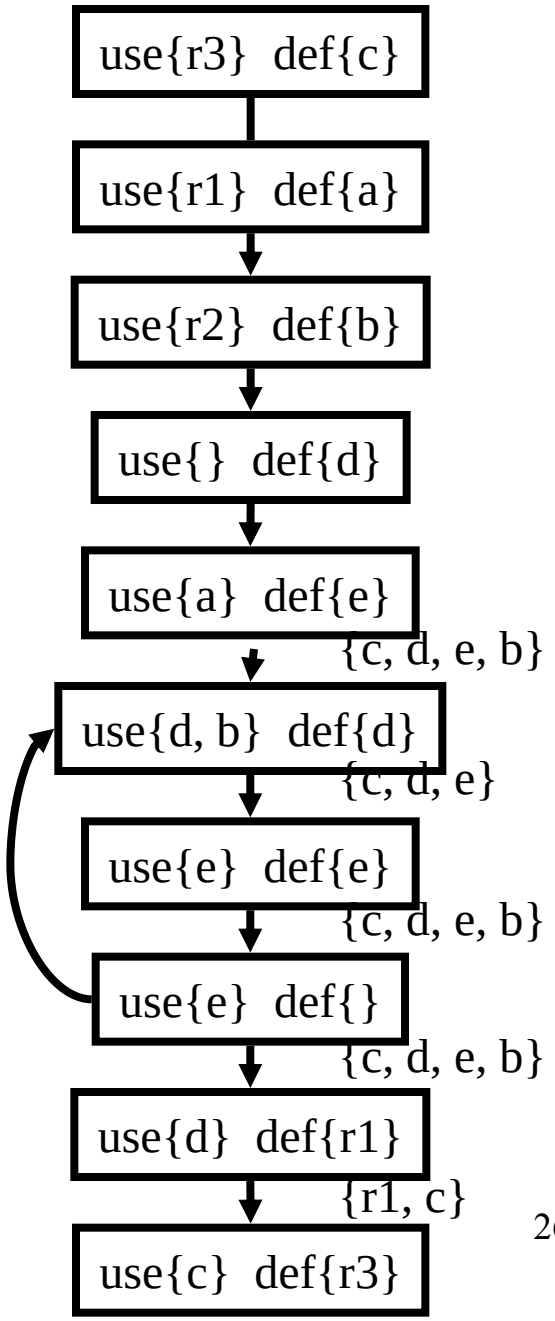
A Complete Example

```
enter:
        c := r3
        a := r1
        b := r2
        d := 0
        e := a
loop:
        d := d+b
        e := e-1
        if e>0 goto loop
        r1 := d
        r3 := c
  return  /* r1,r3 */
```



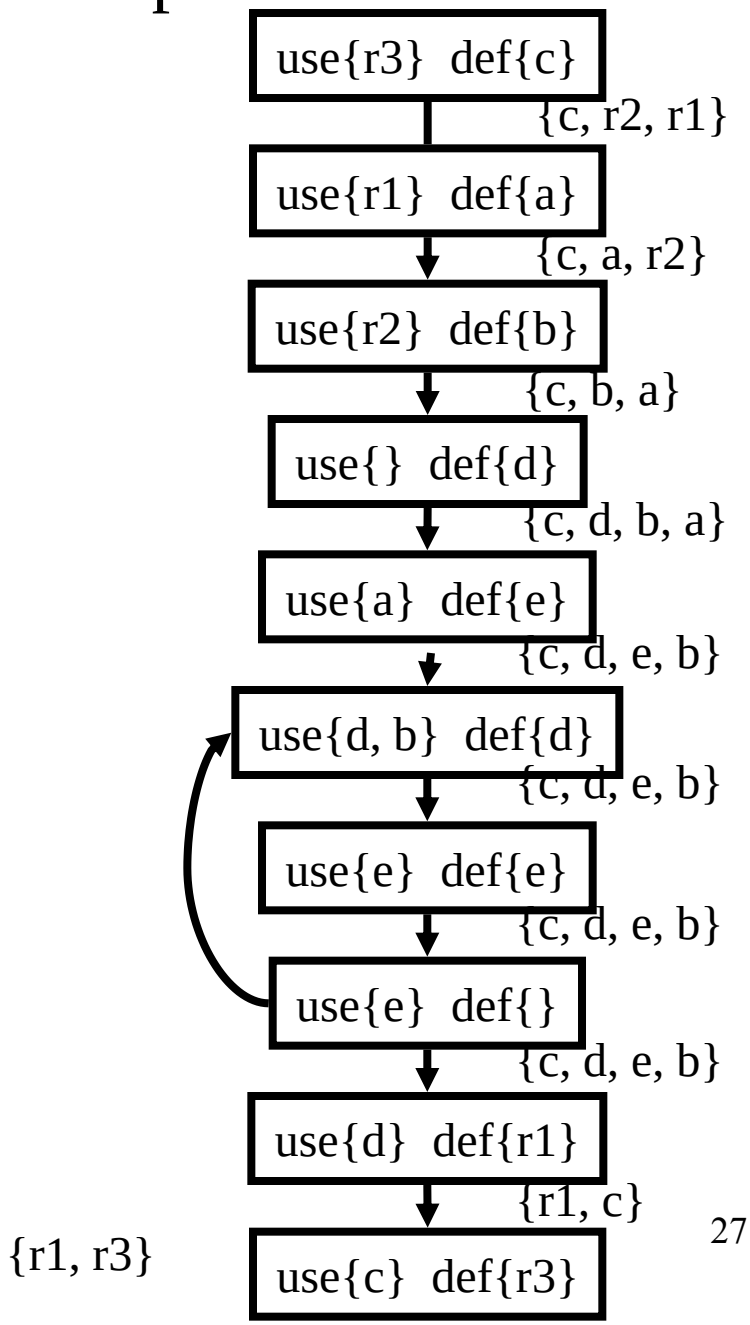
A Complete Example

```
enter:
        c := r3
        a := r1
        b := r2
        d := 0
        e := a
loop:
        d := d+b
        e := e-1
        if e>0 goto loop
        r1 := d
        r3 := c
 return  /* r1,r3 */
```



A Complete Example

```
enter:
        c := r3
        a := r1
        b := r2
        d := 0
        e := a
loop:
        d := d+b
        e := e-1
        if e>0 goto loop
        r1 := d
        r3 := c
 return  /* r1,r3 */
```

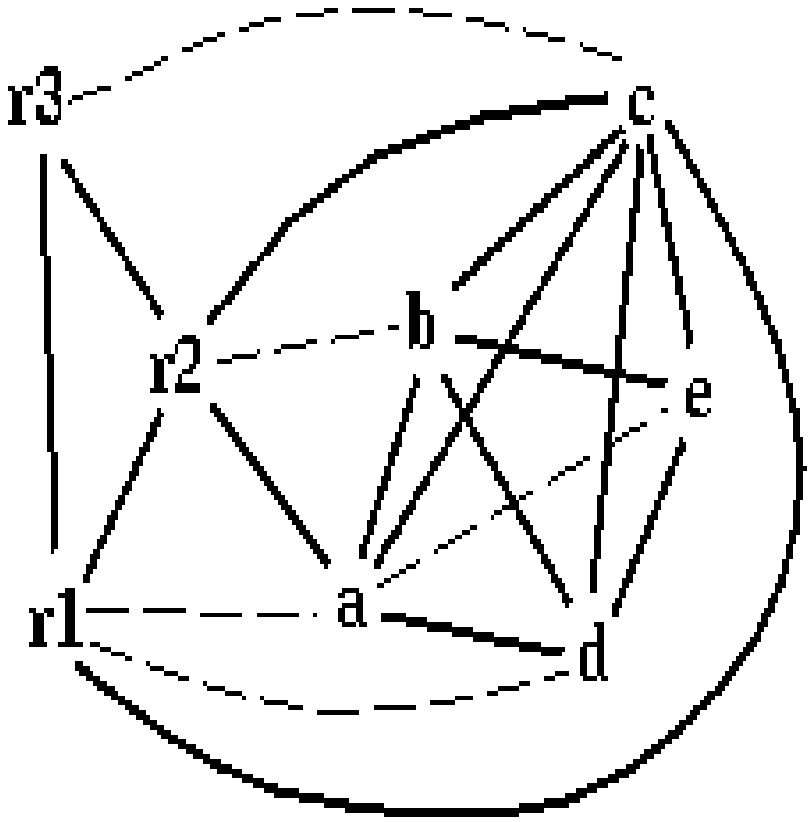


Live Variables Results

```
enter:
        c := r3
        a := r1
        b := r2
        d := 0
        e := a
loop:
        d := d+b
        e := e-1
        if e>0 goto loop
        r1 := d
        r3 := c
  return  /* r1,r3 */
```

```
enter:              /* r2, r1, r3 */
        c := r3     /* c, r2, r1 */
        a := r1     /* a, c, r2 */
        b := r2     /* a, c, b */
        d := 0      /* a, c, b, d */
        e := a      /* e, c, b, d */
loop:
        d := d+b    /* e, c, b, d */
        e := e-1    /* e, c, b, d */
        if e>0 goto loop /* c, d */
        r1 := d     /* r1, c */
        r3 := c     /* r1, r3 */
  return  /* r1, r3 */
```

```
enter                  /* r2, r1, r3 */
        c := r3  /* c, r2, r1 */
        a := r1  /* a, c, r2 */
        b := r2  /* a, c, b */
        d := 0   /* a, c, b, d */
        e := a   /* e, c, b, d */
loop:
        d := d+b  /* e, c, b, d */
        e := e-1 /* e, c, b, d */
        if e>0 goto loop /* c, d */
        r1 := d  /* r1, c */
        r3 := c /* r1, r3 */
 return  /* r1,r3 */
```



spill priority = (uo + 10 ui)/deg

```
enter:                  /* r2, r1, r3 */
        c := r3  /* c, r2, r1 */
        a := r1  /* a, c, r2 */
        b := r2  /* a, c, b */
        d := 0   /* a, c, b, d */
        e := a   / * e, c, b, d */
loop:
        d := d+b  /* e, c, b, d */
        e := e-1 /* e, c, b, d */
        if e>0 goto loop /* c, d */
        r1 := d  /* r1, c */
        r3 := c /* r1, r3 */
 return  /* r1,r3 */
```

	use+ def outside loop	use+ def within loop	deg	spill priority
a	2	0	4	0.5
b	1	1	4	2.75
c	2	0	6	0.33
d	2	2	4	5.5
e	1	3	3	10.3

Interprocedural Allocation

- Allocate registers to multiple procedures
- Potential saving
  - caller/callee save registers
  - Parameter passing
  - Return values
- But may increase compilation cost
- Function inline can help

Summary

- Two Register Allocation Methods
  - Local of every IR tree
    - Simultaneous instruction selection and register allocation
    - Optimal (under certain conditions)
  - Global of every function
    - Applied after instruction selection
    - Performs well for machines with many registers
    - Can handle instruction level parallelism
- Missing
  - Interprocedural allocation
