

Abstract Syntax

Mooly Sagiv

<http://www.cs.tau.ac.il/~msagiv/courses/wcc20.html>

Abstract Syntax

- Intermediate program representation
- Defines a tree - Preserves program hierarchy
- Generated by the parser
- Declared using an (ambiguous) context free grammar (relatively flat)
 - Not meant for parsing
- Keywords and punctuation symbols are not stored (Not relevant once the tree exists)

Topics

- Inductive Definitions
- Context Free Languages
- Example: Expressions

Inductive Definitions

- Many programming language features are defined by induction

Induction in Programming Languages

- The syntax of programming languages is inductively defined
 - A number is **expression**
 - If e_1 and e_2 are **expressions** so is $e_1 + e_2$
- Types are inductively defined
 - int is a **type**
 - if t_1, t_2, \dots, t_k are **types** then
struct $\{ t_1 i_1; t_2 i_2; \dots, t_k i_k; \}$ is a **type** where i_1, i_2, \dots, i_k are identifiers
- Recursive functions
 - $\text{fac}(n) = \text{if } n = 1 \text{ then } 1 \text{ else } n * \text{fac}(n-1)$
 $\text{fac}_1=1, \text{fac}_n=n*\text{fac}_{n-1}$

Mathematical Induction

- $P(n)$ is a property of natural number n
- To show that $P(n)$ holds for every n , it suffices to show that:
 - $P(0)$ is true
 - If $P(m)$ is true then $P(m+1)$ is true for every number m
- In logic
 - $(P(0) \wedge \forall m \in \mathbb{N}. P(m) \Rightarrow P(m+1)) \Rightarrow \forall n \in \mathbb{N}. P(n)$

Course of values Induction

- $P(n)$ is a property of natural number n
- To show that $P(n)$ holds for every n , it suffices to show that for all m if for all $k < m$, $P(k)$ holds then $P(m)$
- In logic
 - $\forall m \in \mathbb{N}. (\forall k < m. P(k)) \Rightarrow P(m) \Rightarrow \forall n \in \mathbb{N}. P(n)$

Context Free Languages

- Inductively define a set of words
- Terminals
- Non-Terminals
 - Start Non-terminal
- Rules
 - Non-Terminal \rightarrow Var₁ Var₂ ... Var_n

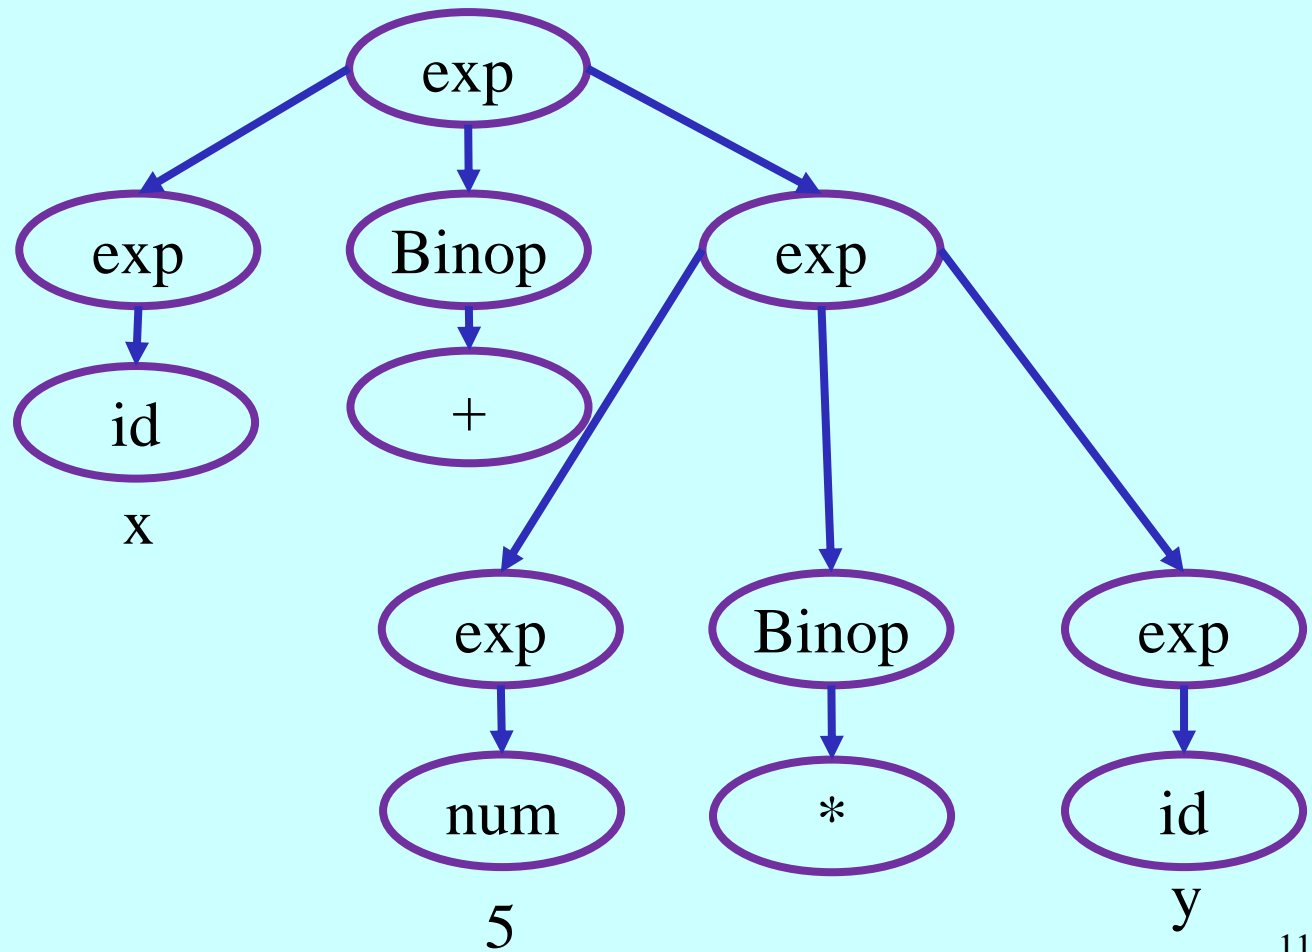

Expression Definition (take 1)

- $\text{exp} \rightarrow \text{id}$
- $\text{exp} \rightarrow \text{num}$
- $\text{exp} \rightarrow \text{exp Binop exp}$ // binary expression
- $\text{exp} \rightarrow \text{Unop exp}$ // unary expression
- $\text{Binop} \rightarrow +$
- $\text{Binop} \rightarrow -$
- $\text{Binop} \rightarrow *$
- $\text{Unop} \rightarrow -$

Questions

- How to show that “ $x + 5 * y$ ” is an expression
- How to show that “ $v v$ ” is not an expression for any v ?

“ $x + 5 * y$ ” $\in L(\text{exp})$

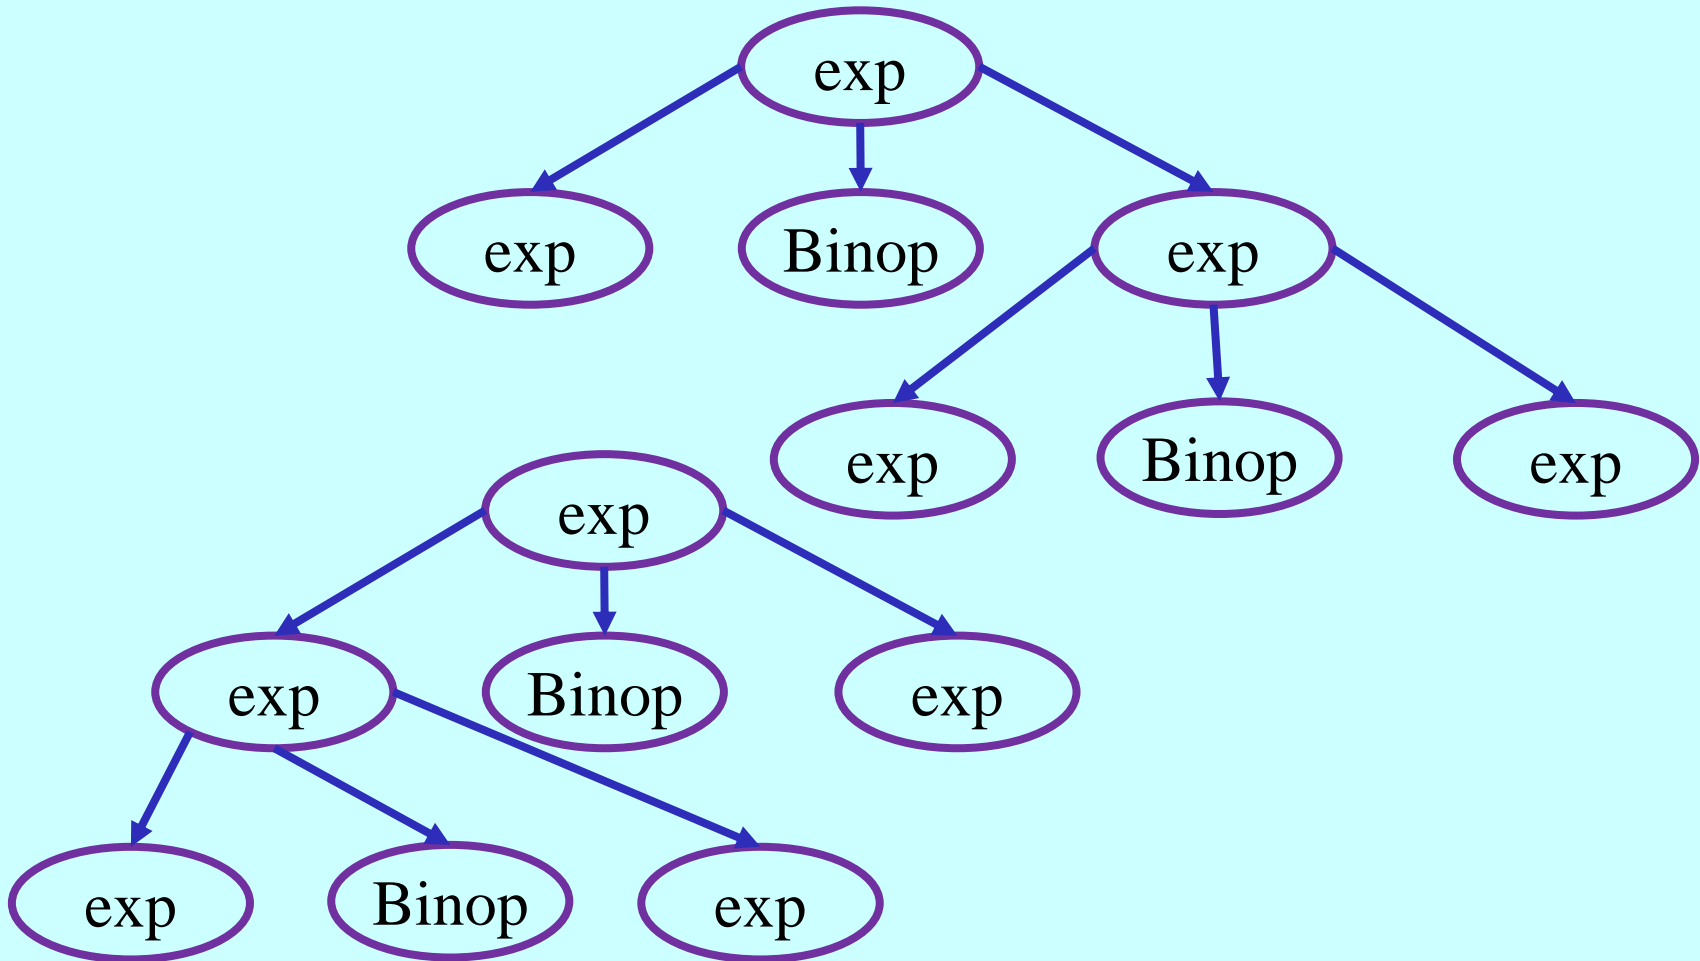

$v v \notin L(\text{exp})$

Ambiguous Context Free Grammars

- Two syntax trees
- [Two leftmost/rightmost derivations]

Ambiguity in Expressions

Non-Ambiguous Expression Grammar

- $\text{exp} \rightarrow \text{term}$
- $\text{exp} \rightarrow \text{exp} + \text{term}$
- $\text{exp} \rightarrow \text{exp} - \text{term}$
- $\text{term} \rightarrow \text{factor}$
- $\text{term} \rightarrow \text{term} * \text{factor}$
- $\text{factor} \rightarrow -\text{factor}$
- $\text{factor} \rightarrow \text{id}$
- $\text{factor} \rightarrow \text{num}$
- $\text{factor} \rightarrow (\text{exp})$

Non-Ambiguous Expression Grammar (BNF)

- $\text{exp} \rightarrow \text{term} \mid \text{exp} + \text{term} \mid \text{exp} - \text{term}$
- $\text{term} \rightarrow \text{factor} \mid \text{term} * \text{factor}$
- $\text{factor} \rightarrow -\text{factor} \mid \text{id} \mid \text{num} \mid (\text{exp})$

Abstract Syntax Tree

- Intermediate program representation
- Not meant for parsing
- Hides irrelevant details
- Defined by an ambiguous grammar

Abstract Syntax for Arithmetic Expressions

$\text{Exp} \rightarrow \mathbf{id}$	(IdExp)
$\text{Exp} \rightarrow \mathbf{num}$	(NumExp)
$\text{Exp} \rightarrow \text{Exp Binop Exp}$	(BinOpExp)
$\text{Exp} \rightarrow \text{Unop Exp}$	(UnOpExp)
$\text{Binop} \rightarrow +$	(Plus)
$\text{Binop} \rightarrow -$	(Minus)
$\text{Binop} \rightarrow *$	(Times)
$\text{Binop} \rightarrow /$	(Div)
$\text{Unop} \rightarrow -$	(UnMin)

```

package Absyn;
abstract public class Absyn { public int pos ;}
Exp extends Absyn { } ;
class IdExp extends Exp { String rep ;
    IdExp(r) { rep = r ;}
}
class NumExp extends Exp { int number ;
    NumExp(int n) { number = n ;}
}
class OpExp {
    public final static int PLUS=1; public final static int Minus=2;
    public final static int Times=3; public final static int Div=4;
}
final static int OpExp.PLUS, OpExp.Minus, OpExp.Times, OpExp.Div;
class BinExp extends Exp {
    Exp left, right; OpExp op ;
    BinExp(Exp l, OpExp o, Bin Exp r) {
        left = l ; op = o; right = r ;
    }
}

```

Summary

- Abstract syntax provides a clear interface with other compiler phases
 - Supports general programming languages
 - Can be stored for large programs
- Automatically generated during parsing
- But the design of an abstract syntax for a given PL may take some time
