Summary

Definition (The ideal bit commitment functionality  $\mathcal{F}_{\text{COM}}$ )

Given parties  $P_1, \dots, P_n$  and adversary  $\mathcal{S}$ :

- 1 Upon receiving input  $\langle \text{Commit}, sid, P_i, P_j, b \rangle$  from party  $P_i$ , **record** the value  $b$  and **send** delayed public output  $\langle \text{Receipt}, sid, P_i, P_j \rangle$  to  $P_j$  **and to**  $\mathcal{S}$ .  
**Ignore** subsequent Commit messages.

Realizations in  
the CRS Model

A Better  
Construction

Summary

- Good for a single, one-bit commitment only.
  - But composable...
- Captures adaptive corruptions.
- No error messages.
- No acknowledgements.
- Committing is public.
- Opened values are public.
- Captures many strong notions of security.
  - Unbounded concurrent composition (universal composition).
  - Non-malleable? Perfect hiding? Perfect binding?

the CRS Model

A Better  
Construction

Summary

## Theorem

There does not exist a **bilateral**, **terminating** protocol that securely realizes  $\mathcal{F}_{\text{COM}}$  in the **plain** model.

## Proof Idea

Suppose  $\mathcal{A}$  merely channels the environment, who corrupts the committer **before** he commits. Due to  $\mathcal{F}_{\text{COM}}$ 's design, in order to simulate the adversary's commitment,  $\mathcal{S}$  has to be able to execute **extraction**. Hence, so can a honest receiver. In contradiction to secrecy.

Summary

- Goal: more efficient CRS reuse.
- Problem: can't reuse **across** applications of the composition theorem.
- Solution: reuse **intra**-application, i.e., intra-functionality.

Definition (The ideal multiple commitments functionality  $\mathcal{F}_{\text{MCOM}}$ )

Identical to  $\mathcal{F}_{\text{COM}}$ , but also takes a **commitment id** (*cid*) parameter from the committer (and passes it to the receiver).

- No ordering restrictions.

# Defining The Functionality

Proof of Security

Summary

## Definition (The ideal bit commitments functionality $\mathcal{F}_{\text{MCOM}}$ )

Given parties  $P_1, \dots, P_n$  and adversary  $\mathcal{S}$ :

- 1 Upon receiving input  $\langle \text{Commit}, sid, cid, P_i, P_j, b \rangle$  from party  $P_i$ , **record** the value  $b$  and **send** delayed public output  $\langle \text{Receipt}, sid, cid, P_i, P_j \rangle$  to  $P_j$  **and to**  $\mathcal{S}$ .  
**Ignore** subsequent Commit messages.
- 2 Upon receiving input  $\langle \text{Open}, sid, cid, P_i, P_j \rangle$  from  $P_i$ : if a value  $b$  was previously recorded, then **send** a public delayed output  $\langle \text{Open}, sid, cid, P_i, P_j, b \rangle$  to  $P_j$  **and**  $\mathcal{S}$ .
- 3 Upon receiving  $\langle \text{Corrupt-committer}, sid, cid \rangle$  from  $\mathcal{S}$ , **send** the recorded value  $b$  to the adversary. As long as Receipt was not yet written on  $P_j$ 's tape, **allow** the adversary to **modify** the recorded value.

## Observations

Realizations of  $\mathcal{F}_{\text{MCOM}}$  must:

- be **extractible** (to simulate corrupted/relay committer).
- be **equivocable** (to simulate corrupted/relay receiver).
- ensure **intra-instance** (inter-*cid*) security ‘manually’ (composition theorem doesn’t apply).

## Note

$\mathcal{F}_{\text{MCOM}}$  **cannot** be realized in the **plain** model.

# Extractibility and Equivocability: Requirements

Construction

What to do with the  $\text{ENC}(0)$  set of coins?

- If kept,  $\mathcal{A}$  will expect them upon corrupting, and  $\mathcal{S}$  will have to manufacture them for its equivocations.
- Solutions:
  - **Erase** those coins.
  - Sample 'ciphertexts' **without** running  $\text{ENC}$ , in a way that allows  $\mathcal{S}$  to find the oblivious-sampling coins for its (non-dummy) ciphertext.

Summary

## Theorem

$\text{UCC}_{\text{ReUse}}$ , with LR-CPA-secure encryption,  
securely realizes  $\mathcal{F}_{\text{COM}}$ .

## Theorem

$\text{UCC}_{\text{ReUse}}$ , with LR-CCA (non-malleable) encryption,  
securely realizes  $\mathcal{F}_{\text{MCOM}}$ .

## Proof Plan

Define hybrids for  $\mathcal{Z}$ 's view:

$H_{\text{real/genuine}}$  Parties running  $\text{UCC}_{\text{ReUse}}$  with adversary  $\mathcal{A}$  in the  
real-life model.

$H_{\text{ideal/fake}}$  Parties running  $\mathcal{F}_{\text{MCOM}}$  with adversary  $\mathcal{S}$  in the  
ideal model.

Goal: show that  $H_{\text{r/g}}$  and  $H_{\text{i/f}}$  are indistinguishable.

(by LR-CPA/LR-CCA-security of the encryption).
- 5  $\text{Prob} [\mathcal{B} \mid H_{i/f}] < \nu$   
(from 3 and 4).
- 6  $\left| \text{Prob} [\mathcal{B} \mid H_{r/f}] - \text{Prob} [\mathcal{B} \mid H_{i/f}] \right| < \nu$   
(from 2 and 5).
- 7  $H_{r/f} \approx H_{i/f}$   
(from 6, since  $\mathcal{B}$  is the only distinction).

- 3 A Better Construction

A young man who is unable to commit a folly  
is already an old man.

—Paul Gauguin

The End.
