

# Texture Synthesis

Daniel Cohen-Or

+

=

# The Goal of Texture Synthesis

- Given a finite sample (large enough) of some texture, the goal is to synthesize other samples from that same texture.

# The Challenge

Need to model the whole spectrum: from repeated to stochastic texture

repeated

stochastic

Both

# Texture Types

# Texture model

**Stationary** - under a proper window size, the observable portion always appears similar.

**Local** - each pixel is predictable from a small set of neighboring pixels and independent of the rest of the image.

# Non-Stationary

# Non-Stationary

# Texture Synthesis for Graphics

- Inspired by Texture Analysis and Psychophysics
  - [Heeger & Bergen,'95]
  - [DeBonet,'97]
  - [Portilla & Simoncelli,'98]
- ...but didn't work well for structured textures
  - [Efros & Leung,'99]
    - (originally proposed by [Garber,'81])

# “By Example” Texture Synthesis

- Input patch boundary.
- Input texture example.
- Fill boundary with texture.

# Texture Synthesis by Non Parametric Sampling

- Generate English-looking text using N-grams, [Shannon,'48]
- Assuming Markov Chain on letters:
  - $P(\text{letter} \mid \text{Proceeding } n\text{-letters})$

E N C Y C L O P E D I 

# Efros & Leung '99

- [Shannon,'48] proposed a way to generate English-looking text using N-grams:
  - Assume a generalized Markov model
  - Use a large text to compute prob. distributions of each letter given N-1 previous letters
  - Starting from a seed repeatedly sample this Markov chain to generate new letters
  - Also works for whole words

WE NEED TO EAT CAKE

# Unit of Synthesis

- **Letter-by-letter**: Used to name planets in early 80s game “Elite”.
- **Word-by-word**: M.V. Shaney (Bell Labs) using alt.singles corpus.
  - *“As I've commented before, really relating to someone involves standing next to impossible.”*
  - *“One morning I shot an elephant in my arms and kissed him.”*
  - *“I spent an interesting evening recently with a grain of salt”.*

# Mark V. Shaney (Bell Labs)

- Notice how well local structure is preserved!
  - Now, instead of letters let's try pixels...

# Efros & Leung 99\*

- Assuming Markov property, compute
  - $P(p \mid N(p))$ .
  - Explicit probability tables infeasible.
  - Instead, *search input image* for similar neighbourhoods - that's our histogram for  $p$ .

Non-parametric  
sampling

\* A.A.Efros, T.K.Leung; "Texture synthesis by non-parametric sampling"; ICCV99.

(originally proposed by [Garber,'81])

# Efros & Leung 99 - Algorithm

Sample

Output

- Causal neighborhood – Neighboring pixels with known values.

# Efros & Leung '99

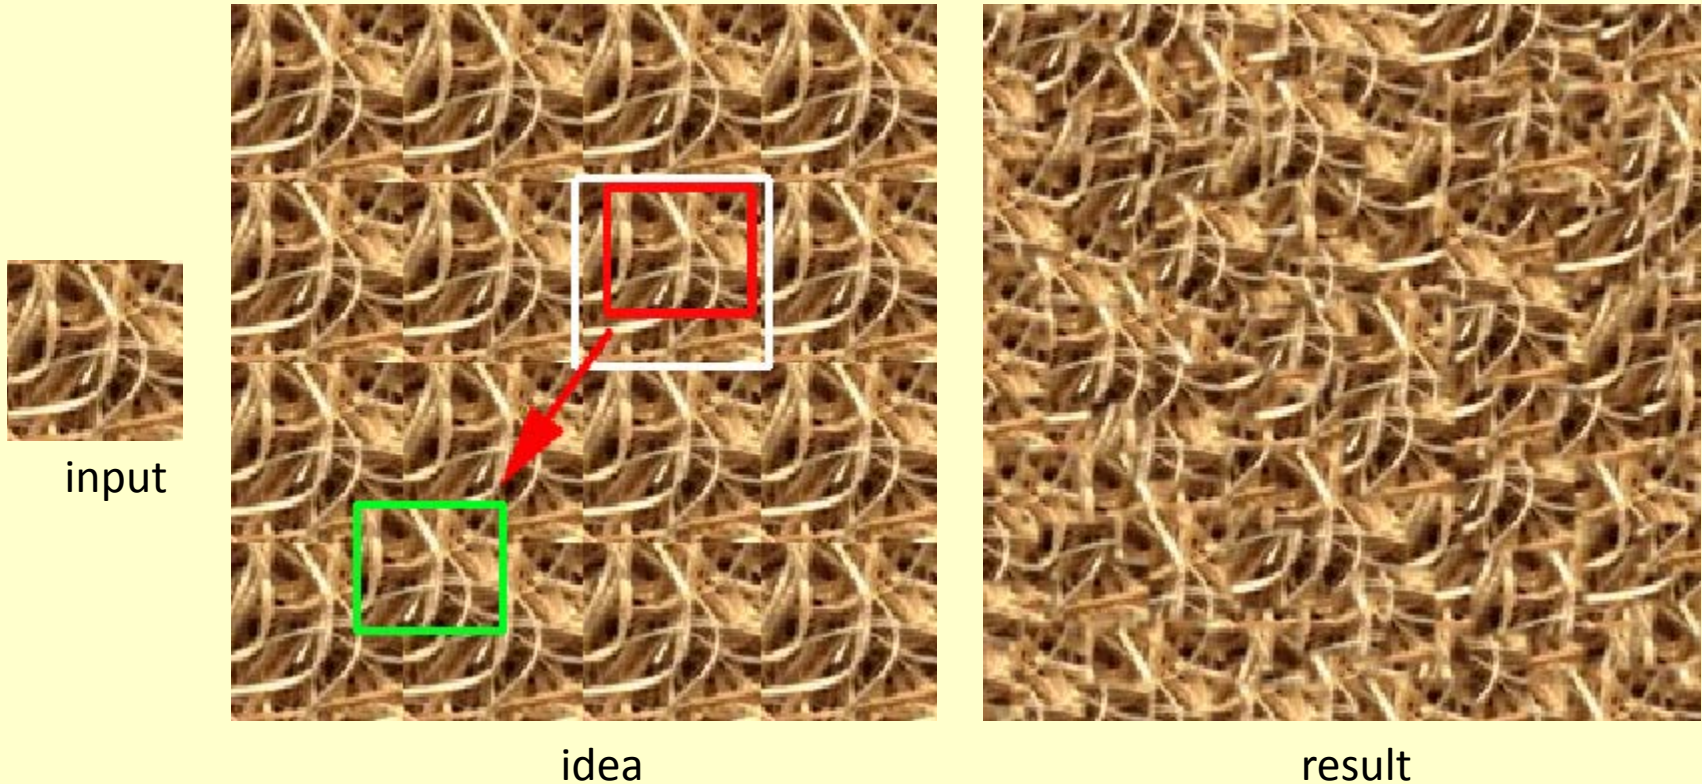

- Assuming Markov property, compute  $P(p | N(p))$ 
  - Building explicit probability tables infeasible
  - Instead, let's search the input image for all similar neighborhoods — that's our histogram for  $p$
- To synthesize  $p$ , just pick one match at random

# Efros & Leung '99

- The algorithm
  - Very simple
  - Surprisingly good results
  - Synthesis is easier than analysis!
  - ...but very slow
- Optimizations and Improvements
  - [Wei & Levoy, '00] (based on [Popat & Picard, '93])
  - [Harrison, '01]
  - [Ashikhmin, '01]
  - PatchMatch [Barnes et al. 2009]

# Chaos Mosaic [Xu, Guo & Shum, '00]

- Process: 1) tile input image; 2) pick random blocks and place them in random locations 3) Smooth edges

Used in Lapped Textures [Praun et.al,'00]

# Chaos Mosaic [Xu, Guo & Shum, '00]

input

result

Of course, doesn't work for structured textures

# Multi-Resolution Pyramids\*

Example texture  
pyramid

\* L.-Y.Wei, M.Levoy; “Fast Texture Synthesis using Tree-structured Vector Quantization”; SIGGRAPH00.

# Extension to 3D Textures

- Motion both in space and time
  - fire, smoke, ocean waves.
- How to synthesize?
  - extend 2D algorithm to 3D.

# The Problems of Causal Scanning

- Scanning order:
  - Efros&Leung<sup>(1)</sup>: Pixels with most neighbors.
  - Wei&Levoy<sup>(2)</sup>: Raster scan.
- These are “causal” scans.

(1) A.A.Efros, T.K.Leung; “*Texture synthesis by non-parametric sampling*”; ICCV99.

(originally proposed by [Garber,'81])

(2) L.-Y.Wei, M.Levoy; “*Fast Texture Synthesis using Tree-structured Vector Quantization*”; SIGGRAPH00.

# The Problems of Causal Scanning

- Can grow garbage.
- No natural means of refining synthesis.
- Cannot be parallelized.
- Problems are made worst for synthesis of 3D space-time volumes (a.k.a. video)...

# Image Quilting

- Observation: neighbor pixels are highly correlated
- Idea:
  - let's combine random block placement of Chaos Mosaic with spatial constraints of Efros & Leung.

# Efros & Leung '99 extended

## Idea: unit of synthesis = block

- Exactly the same but now we want  $P(B | N(B))$
- Much faster: synthesize all pixels in a block at once
- Not the same as multi-scale!

Random placement  
of blocks

Neighboring blocks  
constrained by overlap

Minimal error  
boundary cut

# Minimal error boundary

overlapping blocks

vertical boundary

A diagram illustrating the calculation of the overlap error. Two vertical blocks are shown side-by-side, with a minus sign between them. This is enclosed in large square brackets, followed by a superscript '2'. An equals sign follows, leading to a vertical strip of the image. A red line is drawn along the right edge of this strip, representing the boundary where the error is calculated.

overlap error

min. error boundary

# Our Philosophy

- The “Corrupt Professor’s Algorithm”:
  - Plagiarize as much of the source image as you can
  - Then try to cover up the evidence
- Rationale:
  - Texture blocks are by definition correct samples of texture so problem only connecting them together

# Image Quilting Algorithm

- Pick size of block and size of overlap
- Synthesize blocks in raster order

- Search input texture for block that satisfies overlap constraints (above and left)
  - Easy to optimize using NN search [Liang et.al., '01]
- Paste new block into resulting texture
  - use dynamic programming to compute minimal error boundary cut

## Bush campaign digitally altered TV ad

President Bush's campaign acknowledged Thursday that it had digitally altered a photo that appeared in a national cable television commercial. In the photo, a handful of soldiers were multiplied many times.

This section shows a sampling of the duplication of soldiers.

# Application: Texture Transfer

- Try to explain one object with bits and pieces of another object:

# Texture Transfer

Constraint

Texture sample

# Texture Transfer

- Take the texture from one image and “paint” it onto another object

Same as texture synthesis, except an additional constraint:

1. Consistency of texture
2. Similarity to the image being “explained”
